Source: Editor
ABSTRACT

Draft 2 of 3D-HEVC

- Acceptance of slice header level
- Review GT
- Review CY
- Fix related to F0105.
- Fix #49 Ticket Mismatch in VSP horSplitFlag derivation between WD and HTM
- Review GT
- Harmonize F0108/F0123 according to the above for inter-view ARP.
- DLT related: including F0131, F0139 and moving DLT from VPS to PPS.
- Review CY
- Release v2
- Review GT
- CE3: Results on simple merge candidate list construction for 3DV. It was agreed to add the condition on numMergeCand from F0129. Decision: Adopt F0093 with modifications of F0129
- Cleanup merge list generation 2: Removed VSP flag list
- Cleanup merge list generation 1: Introduced equal motion function.
- Fixes related to F1001.
- Fix vps_inter_sdc_flag.
- Fix number extra merge candidates F1001.
- Non-CE: Illumination compensation flag coding; Decision: Adopt
- HLS: Removal of IC in depth coding and IC flag signalling in 3D-HEVC; Decision: Remove IC for depth map coding, no change for texture coding.
- HLS: On slice-level camera parameter signaling; Decision: Adopt the second solution: the cp_in_slice_segment_layer_flag to be view specific and used as a condition of the presence of slice header level camera parameters.
- Comments on camera parameters in 3D-HEVC, Decision: Adopt (harmonized F0136/F0045)
- HLS: HEVC compatible slice segment header in 3D-HEVC; Decision: Adopt the proposal to move the camera parameters from slice header extension to some place before the slice header extension in slice header under the condition of numLayer_id unequal to 0. If changes are to be made, the MVCCompatibleFlag should also be part of the condition.
- HLS: Constraints on camera parameter signaling; Decision (BF): Add missing brackets in the loop related to the camera parameter signaling.
- CE4: ARP reference picture selection and its availability check; One aspect suggests to use the first temporal reference picture instead of the first entry in each reference picture list (same as F0123). Another aspect proposes to check whether ARP fixed reference picture is in DPB marked as “used for reference”, which is explicitly indicated in reference layer’s RPS. The text was revised from the original proposal to have a slice level check. Decision: Adopt
- Added General decoding process for prediction units in inter prediction mode
- CE3: Sub-PU level inter-view motion prediction. Decision: Adopt, specify 8x8 in CTC
- CE3: Inter-view motion vector prediction for depth coding Decision: Adopt F0125.
- CE1: Simplified view synthesis prediction Decision: Adopt both simplifications suggested in F0111.
- CE3: Removal of redundancy on VSP, ARP and IC Decision: Adopt F0104 (without IC_ARP_DEPEND) Item 2 has already been decided to study in CE as per the discussion in CE4.
- CE4: Coding of weighting factor of advanced residual prediction; Decision: Adopt.
- Ed. five_minus_max_num_merge_cand Added updated semantics of five_minus_max_num_merge_cand from HEVC version 1.
- CE3: MPI candidate in depth merge mode list construction Decision: Adopt (option 1)
(3DN-09/JCT3V-F0109, JCT3V-F0120) CE1: A simplified block partitioning method for view synthesis prediction

Decision: Adopt (F0109/F0120) (Identical)

(3DN-08/JCT3V-F0102) CE1: VSP partitioning for AMP Decision: Adopt F0102

(3DN-07/JCT3V-F0115) CE2: Problem fix of the DV derivation in 3D-HEVC Decision: Adopt the suggested solution which aligns the text with the software bug fix.

(3DN-06/JCT3V-F0149) CE5: Simplified depth inter mode coding: Adoption (BF): Align the text with software as suggested in F0149.

(3DN-05/JCT3V-F0147) CE5: DMM simplification and signalling Decision: Adopt (remove DMM3 and RBC).

(3DN-04/JCT3V-F0159) CE5: Fast depth lookup table application method to intra modes for depth data ;Decision: Adopt F0159 method 3. Implement an enabling flag at (position t.b.d.).

(3DN-03/JCT3V-F0132) CE5: Unification of delta DC coding for depth intra modes.

(3DN-01/JCT3V-F0171) CE5: Fix for DMM/RBC reference sample filtering.

(3DC-00 Review GT)

Draft 1 of 3D-HEVC

Ed. Notes (Draft 1) (changes compare to JCT3V-D1005)

- Accept changes marks.
- Release v2
- Fix disparity derivation
- Review, cleanups.
- Update definitions.
- Removal further unused parts of overlap between DMM1 and DMM3.
- Fix refIdx for VSP.
- Added missing dv-scaling of item 3.
- Revised editors comments. Fixed ticket #41, #42, #43
- Update to HEVC version 1
- Release v1
- Camera parameter presence indication.
- Fix tickets #35, #30, #32, #33, #34, #37
- CE3: Merge candidates derivation from vector shifting.
- CE2: Simplified NBDV and improved disparity vector derivation
- CE1: Adaptive block partitioning for VSP and clipping.
- CE2: Clipping in depth-based disparity vector derivation
- CE6: Simplified Inter Mode Coding of Depth Decision
- Added Decoding process for the residual signal of coding units coded in inter predmode from base spec
- HLS: Revision of the Alternative Depth Info SEI message
- HLS: Make 3D-HEVC Compatible with MV-HEVC Adopt (solution 2)
- HLS: Signalling of camera parameters.
- HLS: On parameter sets. Adopt View Id aspect
- HLS: Only portion that swaps multiview and depth flag in scalability dimension
- CE3: A bug-fix for the texture merging candidate
- (3DC-GT1) Review and editorial improvements
- CE2: Disparity inter-view motion vector derivation
- CE2: DVMPN Fix
- CE3: Motion data buffer reduction for 3D-HEVC Decision: Adopt (first scheme)
- Simplified DC calculation for SDC
- On DMM simplification
- Simplified Binarization for depth_intra_mode
- Removal of overlap between DMM1 and DMM3
- Removal of DC from SDC Mode
- DMM simplification and signalling. Remove DMM2.
- Complexity reduction of bi-prediction for illumination compensation
- CE4: Resampling in IC parameter derivation and 4x4 Chroma removal

Decision: Adopt: JCT3V-E0046
Ed. Notes (TM4) (changes compare to JCT3V-C1005):

- ------------ Release v4 ------------
- Accepted all change marks.
- ------------ Release v3 ------------
- (3DN-GT4) Review and editorial improvements
- ------------ Release v2 ------------
- (3DN-22/JCT3V-D0166) On reference view selection in NBDV and VSP
- (3DC-01 availableFlagDV) Fixed availability flag for disparity vector.
- (3DC-GT3) Review and editorial improvements
- (3DC-CY1) Review and editorial improvements
- ------------ Release v1 ------------
- (3DC-GT2) Clean-up of variables not used any more (related to disparity derivation)
- (3DN-21/D0220/ViewId) ViewId not reflecting coding order any more.
- (3DN-20/JCT3V-D0272) Signaling Global View and Depth
- (3DN-19/JCT3V-D0103) Signaling Warp Maps as an Alternative 3D Format
- (3DN-18/JCT3V-D0032/JCT3V-D0141/JCT3V-D0034) SDC Residual CABAC contexts.
- (3DN-17/JCT3V-D0035) DLT for DMM deltaDC coding
- (3DN-16/JCT3V-D0195) Unification of new intra modes in 3D-HEVC
- (3DN-15/JCT3V-D0193) Clean-up for 64x64 SDC
- (3DN-14/JCT3V-D0183) Simplified DC predictor for depth intra modes
- (3DN-13/JCT3V-D0110) Sample-based simplified depth coding.
- (3DN-12/JCT3V-D0060) Removal of parsing dependency for illumination compensation
- (3DN-11/JCT3V-D0122) AMVP candidate list construction
- (3DN-10/JCT3V-D0091) Inter-view SAO process in 3DV coding
- (3DN-09/JCT3V-D0177) Advanced residual prediction for multi-view coding
- (3DN-08/JCT3V-D0138) Simplified DV derivation for DoNBDV and BVSP
- (3DN-07/JCT3V-D0112) Default disparity vector derivation
- (3DN-06/JCT3V-D0105) BVSP NBDV
- (3DN-05/JCT3V-D0191) Clean-ups for BVSP in 3D-HEVC.
- (3DN-04/JCT3V-D0092) CE1.h related: BVSP mode inheritance
- (Incorporated 8.5.2.1.3 from base spec) Derivation process for combined bi-predictive merging candidates.
- (3DN-03/JCT3V-D0181) CE2.h related: CU-based Disparity Vector Derivation
- (Incorporated 8.5 from base spec)
- (3DN-02/JCT3V-D0135) CE5: Unification of disparity vector rounding
- (3DN-01/JCT3V-D0156): HLS for stereo compatibility.(Also covers disabling of VSP for depth as proposed in D0105 and D0139).

- (3DC-GT1) Editorial improvements, small corrections.

Ed. Notes (TM3) (changes compare to JCT3V-B1005):

- (3Dc-04) Revised text related to edge intra.
- (3DC-GT2) Editorial improvements, small corrections.(among others tickets #21 #22)
- ------------ Release d0 ------------
- Converted to .doc-File
- Split of Test Model text and specification text
- (3DE-05) Alignment with MV-HEVC draft 3.
- (3DE-01) Reordered sub-clauses related to disparity estimation and additional motion candidates.
- (3DN-20) Alignment of JCT3V-C0152 + JCT3V-C0137.
- (3DN-07/JCT3V-C0137) Texture motion vector candidate for depth.
- (3DN-07/JCT3V-C0137) Removal of MPI.
- (3DN-19) Camera parameters
- (3Dn-03) Wedgelet pattern generation process.
- (3Dn-01) Incorporated missing intra-predicted wedgelet partition mode
- (3DN-08/JCT3V-C0138) Removal of parsing dependency for inter-view residual prediction.
- (3DN-18/JCT3V-C0160) QTL disabled for RAP.
- (3DN-17/JCT3V-C0154) Reference sub-sampling for SDC and DMM.
- (3Dc-03) Fix SDC
- (3DN-16/JCT3V-C0096) Removal of DMM 2 from SDC.
- (3DN-15/JCT3V-C0034) Delta DC processing for DMMs.
- (3DN-14/JCT3V-C0044) Signalling of wedgeIdx for DMM3.
- (3DN-02/JCT3V-C0152) View synthesis prediction (without disparity derivation part).
3D-HEVC

- (3DN-03/JCT3V-C0112) Restricted search of max disparity.
- (3DN-01,02/JCT3V-C0131,JCT3V-C0152) Disparity derivation from depth maps.
- (3Dc-02) Incorporated missing conditions of long/short-term pictures in AMVP (related to JCT3V-B0046).
- (3DN-13/JCT3V-C0116) Inter-view vector scaling for AMVP.
- (3DE-03) Incorporated derivation process for AMVP from base spec.
- (3DN-12/JCT3V-C0115) Signalling of inter-view motion vector scaling.
- (3DE-02) Incorporated TMVP text from base spec.
- (3DN-09/JCT3V-C0042) Alternative reference index for TMVP.
- (3DN-10/JCT3V-C0051) Unification of inter-view candidate derivation.
- (3DE-01) Revised text related to residual prediction.
- (3DN-06/JCT3V-C0129) Vertical component in residual prediction.
- (3DN-05/JCT3V-C0097/JCT3V-C0141) Temporal blocks first in DV derivation.
- (3DC-GT1) Editorial improvements, small corrections.
- (3DN-04/JCT3V-C0135) Restriction on the temporal blocks for memory bandwidth reduction in DV derivation.
- (3Dn-02) Full sample MV accuracy for depth.
- (3DN-11/JCT3V-C0046) Extension of illumination compensation to depth.
- (3Dc-01) Fix illumination compensation (including ic_flag for skip).

Ed. Notes (TM2) (changes compared to JCT3V-A1005)

- Accepted changes and marked delta to base spec
- (3DC-GT2) Editorial improvements, small corrections
- (3DC-CY) Editorial improvements, small corrections
- (MVS-02/JCT3V-B0046) Treatment of inter-view pictures as long term-reference pictures
- (3DE-11) Revised text related to 3Dn-01
- (3Dn-01/m23639) Results on motion parameter prediction
- (3DE-12) Revised text related residual prediction
- (3DE-10) Revised text Related to Illumination compensation.
- (3DN-01/JCT3V-B0045) Illumination compensation for inter-view prediction.
- (3Dn-02/m24766) Restricted Inter-View Residual Prediction
- (3DE-09) Revised text related to depth intra: Edge Intra
- (3DE-09) Revised text related to depth intra: SDC
- (3DE-09) Revised text related to depth intra: DMMs
- (3DO-01/JCT3V-B0131) Depth distortion metric with a weighted depth fidelity term
- (3DN-12/JCT3V-B0036) Simplified Depth Coding with an optional Depth LUT
- (3DN-13/JCT3V-B0039) Simplified Wedgelet search for DMM modes 1 and 3
- (3DN-03/JCT3V-B0083) Unconstrained motion parameter inheritance
- (3DE-08) Incorporated context tables for SDC
- (3DE-07) Improved MPI text.
- (3DN-02/JCT3V-B0068) Incorporated Depth Quadtree Prediction.
- (3DE-06) Incorporated parsing process, including tables for DMMs.
- (3DE-05) Added missing initialization of invalid motion/disparity parameters
- (3DC-03) Added missing pruning of collocated merge candidate due to number of total candidates.
- (3DE-04) Moved pruning of spatial merge candidate B2 due to number of total candidates.
- (3DE-03) Moved derivation of disparity one level higher in process hierarchy.
- (3DE-02) Inserted "Derivation process for motion vector components and reference indices” from base spec
- (3DC-02) Fixed storage of IvpMvFlagLX and IvpMvDisp.
- (3DN-09-10-11/JCT3V-B0048,B0069,B0086) Modification inter-view merge candidates
- (3DC-01) Fixed derivation of inter-view merge candidates.
- (3DE-01) Revised derivation of disparity from temporal candidates
- (3DN-04/JCT3V-B0047) Improvements for disparity vector derivation
- (3DN-08/JCT3V-B0136) Support of parallel merge in disparity vector derivation
- (3DN-05/JCT3V-B0135) Modifed disparity vector derivation process for memory reduction
- (3DN-04/JCT3V-B0111) Decoupling inter-view candidate for AMVP
- (3DN-07/JCT3V-B0096) Removal of dependency between multiple PUs in a CU for DV-derivation
- (3DC-GT) Small corrections, editorial improvements

Ed. Notes (TM1) (changes compare to N12744)
- (3D08/JCT3V-A0126) (T,N) Simplified disparity derivation
- (3D16) Moved 3D-tool related flags from SPS to VPS, removal camera parameters
- (3D09/JCT3V-A0049) (N) Inter-view motion prediction modification
- (3D13/JCT3V-A0119) (T) VSO depth fidelity
- (3D07/JCT3V-A0070) (T,N) Region boundary chain coding for depth maps
- (3D06/JCT3V-A0087) (T) RDO selection between Non-Zero Residual and All-Zero Residual Intra
- (3D12) (T) Depth Quadtree Prediction
- (3D15) (N) Fix references
- (3D11) (T,N) Improvement of text of already adopted tools
- (3D10/JCT3V-A0097) (T,N) Disparity vector generation
- (3D02) (N) Removed MV-Part and update to Annex F
- (3D03) (T) Labelling of tools not in CTC/Software. Removal?
- (3D05/JCT3V-A0093) (T) VSO early skip
- (3D04/JCT3V-A0033) (T) VSO model based estimation
- (3D14) (N) Update of low level specification to match HEVC text specification 8(d7)
- (3D01) (N): Removed HEVC text specification

3D High Efficiency Video Coding Draft Specification

The specifications made in this section are based on HEVC version 1 and MV-HEVC draft 6 (JCT3V-F1004).

In text blocks copied from HEVC version 1 or MV-HEVC draft 6 changes are highlighted.

Modifications of HEVC specification:

In Foreword replace paragraph that start with "In this Recommendation | International Standard Annexes":

In this Recommendation | International Standard Annexes A through H contain normative requirements and are an integral part of this Recommendation | International Standard.

In 0.7, add the following paragraph after the paragraph that starts with "Annex F":

Annex H specifies multiview and depth video coding, referred to as 3D High Efficiency Video Coding (3D-HEVC). The reader is referred to Annex H for the entire decoding process for 3D-HEVC, which is specified there with references being made to clauses 1-9 and Annexes A-G.

Annex H 3D High Efficiency Video Coding
[Ed. (GT) Annex character and title formatting need to be updated.]

This annex specifies 3D high efficiency video coding, referred to as 3D-HEVC.

H.1 Scope

Bitstreams and decoders conforming to the profile specified in this annex are completely specified in this annex with reference made to clauses 2-9 and Annexes A-G.

[Ed. (GT): Some references to Annex F might be replaced to references to Annex G and vice versa. This should be fixed when MV-HEVC structure is finalized. When a referenced subclause does not exist in Annex G, the corresponding subclause in Annex F is valid or vice versa.]

H.2 Normative references

The specifications in clause 2 apply.

H.3 Definitions

For the purpose of this annex, the following definitions apply in addition to the definitions in clause F.3 and G.3. These definitions are either not present in clause F.3 and G.3 or replace definitions in clause F.3 and G.3.

H.3.1 depth view: A sequence of pictures associated with the same value of ViewOrderIdx and DepthFlag equal to 1.

H.3.2 depth view component: A coded representation of a the depth view.

H.3.3 texture view: A sequence of pictures associated with the same value of ViewOrderIdx and DepthFlag equal to 0.

H.3.4 texture view component: A coded representation of a the texture view.

H.3.5 view component: A coded representation of a view that may contain a depth view component and a texture view component.

H.4 Abbreviations

The specification in clause 4 apply.
3D-HEVC

H.5 Conventions
The specification in clause 5 apply.

H.6 Source, coded, decoded and output data formats, scanning processes, and neighbouring relationships
The specification in clause 6 apply.

H.7 Syntax and semantics
This clause specifies syntax and semantics for coded video sequences that conform to one or more of the profiles specified in this annex.

H.7.1 Method of specifying syntax in tabular form
The specifications in subclause 7.1 apply.

H.7.2 Specification of syntax functions, categories, and descriptors
The specifications in subclause 7.2 apply.

H.7.3 Syntax in tabular form

H.7.3.1 NAL unit syntax
The specifications in subclause G.7.3.1 and all its subclauses apply.

H.7.3.2 Raw byte sequence payloads and RBSP trailing bits syntax

H.7.3.2.1 Video parameter set RBSP
The specifications in subclause G.7.3.2.1 apply.

[ Ed. (GT): Inclusion of potential VPS extension 3 needs to be specified. ]

H.7.3.2.1.1 Video parameter set extension syntax
The specifications in subclause G.7.3.2.1.1 apply.
H.7.3.2.2 Video parameter set extension 2 syntax

H.7.4.2.2 NAL unit header semantics

The specification in subclause G.7.4.2.2 apply with the following modifications and additions.

The variable RapPicFlag is derived as specified in the following:

\[
\text{RapPicFlag} = ( \text{nal_unit_type} \geq \text{BLA}_W_{\text{LP}} \&\& \text{nal_unit_type} \leq \text{RSV}_{\text{IRAP}_{\text{VCL23}}} )
\]  

H.7.4.2.3 Encapsulation of an SODB within an RBSP (informative)

The specifications in subclause G.7.4.2.3 apply.

H.7.4.2.4 Order of NAL units and association to coded pictures, access units, and video sequences

The specifications in subclause G.7.4.2.4 apply.

H.7.4.3 Raw byte sequence payloads, trailing bits, and byte alignment semantics

H.7.4.3.1 Video parameter set RBSP semantics

The specifications in subclause G.7.4.3.1 apply, with the following modifications and additions:

\text{vps\_extension2\_flag} \text{ equal to 0 specifies that no vps\_extension2( ) syntax structure is present in the VPS RBSP syntax structure. vps\_extension\_flag equal to 1 specifies that the vps\_extension2( ) syntax structure is present in the VPS RBSP syntax structure. The variable MvHevcCompatibilityFlag is set equal to !vps\_extension2\_flag. [ Ed.(GT): At some stage this might be changed to profile Idc. Moreover, vps\_extensions for different HEVC extensions need to be harmonized. ]}

\text{vps\_extension3\_flag} \text{ equal to 0 specifies that no vps\_extension3\_data\_flag syntax elements are present in the VPS RBSP syntax structure. vps\_extension2\_flag shall be equal to 1 in bitstreams conforming to Annex H of this Recommendation [International Standard. The value of 1 for vps\_extension3\_flag is reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore all data that follow the value 1 for vps\_extension3\_flag in a VPS NAL unit.}

H.7.4.3.1.1 Video parameter set extension semantics

The specifications in subclause G.7.4.3.1.1 apply, with the following modifications and additions:

- Table F-1 is replaced by Table H-1.

<table>
<thead>
<tr>
<th>scalability mask index</th>
<th>Scalability dimension</th>
<th>ScalabilityId mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Depth</td>
<td>Depth Flag</td>
</tr>
<tr>
<td>1</td>
<td>Multiview</td>
<td>View Order Index</td>
</tr>
<tr>
<td>2-15</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

The variable ScalabilityId[i][smIdx] specifying the identifier of the smIdx-th scalability dimension type of the i-th layer, the variable ViewOrderIdx[layer_id_in_nuh[i]] specifying the view order index of the i-th layer, the variable VpsDepthFlag[layer_id_in_nuh[i]] specifying the depth flag of the i-th layer, and the variable ViewScalExtLayerFlag specifying whether the i-th layer is a view scalability extension layer are derived as follows:

\[
\text{NumViews} = 1 \\
\text{for}(i = 0; i < \text{vps\_max\_layers\_minus1}; i++) \{ \\
\text{lid} = \text{layer\_id\_in\_nuh[i]} \\
\text{for}(\text{smIdx} = 0; j < 16; \text{smIdx}++) \\
\text{if}(\text{scalability\_mask\_flag[smIdx]}) \\
\text{ScalabilityId[i][smIdx] = dimension\_id[i][j++]}
\]
VpsDepthFlag[ lId ] = ScalabilityId[ i ] [ 0 ]
ViewOrderIdx[ lId ] = ScalabilityId[ i ] [ 1 ]
if( i > 0 && (ViewOrderIdx[ lId ] != ScalabilityId[ i - 1 ] [ 1 ]))
NumViews++
ViewScalExtLayerFlag[ lId ] = (ViewOrderIdx[ lId ] > 0)

The function ViewIdx( picX ) is specified as follows:
ViewIdx( picX ) = ViewOrderIdx[ nuh_layer_id of the picture picX ]

The function DepthFlag( picX ) is specified as follows:
DepthFlag( picX ) = VpsDepthFlag[ nuh_layer_id of the picture picX ]

The function ViewId( picX ) is specified as follows:
ViewId( picX ) = ViewId[ nuh_layer_id of the picture picX ]

The function DiffViewId( picA, picB ) is specified as follows:
DiffViewId( picA, picB ) = ViewId( picA ) − ViewId( picB )

H.7.4.3.1.2 Video parameter set extension 2 semantics

iv_mv_pred_flag[ layerId ] indicates whether inter-view motion parameter prediction is used in the decoding process of the layer with nuh_layer_id equal to layerId. iv_mv_pred_flag[ layerId ] equal to 0 specifies that inter-view motion parameter prediction is not used for the layer with nuh_layer_id equal to layerId. iv_mv_pred_flag[ layerId ] equal to 1 specifies that inter-view motion parameter prediction may be used for the layer with nuh_layer_id equal to layerId. When not present, the value of iv_mv_pred_flag[ layerId ] is inferred to be equal to 0.

log2_sub_pb_size_minus2[ layerId ] specifies the value of the variable SubPbSize[ layerId ] that is used in the decoding of prediction units using the inter-view merge candidate. The value of log2_sub_pb_size_minus2 shall be in the range of 0 to 4, inclusive.

[Ed. (CY): There sounds to be no need and no agreement to send this syntax element for each view. In addition, sub-PU doesn’t apply to depth views.]

The variable SubPbSize[ layerId ] is derived as specified in the following:
SubPbSize[ layerId ] = VpsDepthFlag( layerId ) ? 64 : 1 << (log2_sub_pb_size_minus2[ layerId ] + 2)

[Ed. (GT): The derivation of SubPbSize corresponds to the fixed derivation process in HTM-9.0r1. Further discussions might be required. ]

iv_res_pred_flag[ layerId ] indicates whether inter-view residual prediction is used in the decoding process of the layer with nuh_layer_id equal to layerId. iv_res_pred_flag[ layerId ] equal to 0 specifies that inter-view residual prediction is not used for the layer with nuh_layer_id equal to layerId. iv_res_pred_flag[ layerId ] equal to 1 specifies that inter-view residual prediction may be used for the layer with nuh_layer_id equal to layerId. When not present, the value of iv_res_pred_flag[ layerId ] is inferred to be equal to 0.

view_synthesis_pred_flag[ layerId ] equal to 0 specifies that view synthesis prediction merge candidates are not used for the layer with nuh_layer_id equal to layerId. view_synthesis_pred_flag[ layerId ] equal to 1 specifies that view synthesis prediction merge candidates might be used for the layer with nuh_layer_id equal to layerId. When not present, the value of view_synthesis_pred_flag[ layerId ] is inferred to be equal to 0.

depth_refinement_flag[ layerId ] equal to 0 specifies that depth view components are not used in the derivation process for a disparity vector for the layer with nuh_layer_id equal to layerId. depth_refinement_flag[ layerId ] equal to 1 specifies that depth components are used in the derivation process for a disparity vector for the layer with nuh_layer_id equal to layerId. When not present, the value of depth_refinement_flag[ layerId ] is inferred to be equal to 0.

mpi_flag[ layerId ] equal to 0 specifies that motion parameter inheritance is not used for the layer with nuh_layer_id equal to layerId. mpi_flag[ layerId ] equal to 1 specifies that motion parameter inheritance may be used for the layer with nuh_layer_id equal to layerId. When not present, the value of mpi_flag[ layerId ] is inferred to be equal to 0.

vps_depth_modes_flag[ layerId ] equal to 1 specifies that depth map modelling modes, the chain coding mode and simplified depth coding modes may be used in the decoding process of the layer with layer_id equal to layerId. vps_depth_modes_flag[ layerId ] equal to 0 specifies that depth map modelling modes, the chain coding mode and simplified depth coding modes are not used in the decoding process of the layer with layer_id equal to layerId. When not present, vps_depth_modes_flag[ layerId ] is inferred to be equal to 0.

lim_qt_pred_flag[ layerId ] equal to 1 specifies that prediction of a limited quadtree is used for the layer with
nuh_layer_id equal to layerId. lim qt pred_flag[ layerId ] equal to 0 specifies that prediction of a limited quadtree is not used for the layer with nuh_layer_id equal to layerId. When not present, the value of lim qt pred_flag[ layerId ] is inferred to be equal to 0.

vps_inter_sdc_flag[ layerId ] equal to 1 specifies that inter SDC coding is used for the layer with nuh_layer_id equal to layerId. vps_inter_sdc_flag[ layerId ] equal to 0 specifies that inter SDC coding is not used for the layer with nuh_layer_id equal to layerId. When not present, the value of vps_inter_sdc_flag[ layerId ] is inferred to be equal to 0.

cp_precision specifies the precision of vps cp scale[ i ][ j ], vps cp off[ i ][ j ], vps cp inv scale plus scale[ i ][ j ], and vps cp inv off plus off[ i ][ j ] in the VPS and cp scale[ j ], cp off[ j ], cp inv scale plus scale[ j ], and cp inv off plus off[ j ] in the slice segment header. The value of cp_precision shall be in the range of 0 to 5, inclusive.

cp_present_flag[ i ] equal to 1 specifies that the syntax elements vps cp scale[ i ][ j ], vps cp off[ i ][ j ], vps cp inv scale plus scale[ i ][ j ], and vps cp inv off plus off[ i ][ j ] are present in the VPS or that cp scale[ j ], cp off[ j ], cp inv scale plus scale[ j ], and cp inv off plus off[ j ] are present in slice segment headers with nuh_layer_id equal to layerId and VpViewIdx[ layerId ] equal to i. cp_present_flag[ i ] equal to 1 indicates that camera parameters are not present.

For layerId in the range of 0 to MaxLayersMinus1, inclusive, the following applies:

\[
\text{cpRequiredFlag[ layerId ] = depth_refinement_flag[ layerId ] || view_synthesis_pred_flag[ layerId ] || ( iv_mv_pred_flag[ layerId ] && VpsDepthFlag[ layerId ] )}
\] (H-7)

When, for any value of layerId, cpRequiredFlag[ layerId ] is equal to 1, the value of cp_present_flag[ VpViewIdx[ layerId ] ] shall be equal to 1. When not present, the value of cp_present_flag[ i ] is inferred to be equal to 0.

cp_in_slice_segment_header_flag[ i ] equal to 1 specifies that the syntax elements vps cp scale[ i ][ j ], vps cp off[ i ][ j ], vps cp inv scale plus scale[ i ][ j ], and vps cp inv off plus off[ i ][ j ] are not present in the VPS and that the syntax elements cp scale[ j ], cp off[ j ], cp inv scale plus scale[ j ], and cp inv off plus off[ j ] are present in slice segment headers with nuh_layer_id equal to layerId and VpViewIdx[ layerId ] equal to i. cp_in_slice_segment_header_flag[ i ] equal to 0 specifies that the syntax elements vps cp scale[ i ][ j ], vps cp off[ i ][ j ], vps cp inv scale plus scale[ i ][ j ], and vps cp inv off plus off[ i ][ j ] syntax elements are present in the VPS and that the syntax elements cp scale[ j ], cp off[ j ], cp inv scale plus scale[ j ], and cp inv off plus off[ j ] are not present in slice segment headers with nuh_layer_id equal to layerId and VpViewIdx[ layerId ] equal to i. When not present, the value of cp_in_slice_segment_header_flag[ i ] is inferred to be equal to 0.

vps cp scale[ i ][ j ], vps cp off[ i ][ j ], vps cp inv scale plus scale[ i ][ j ], and vps cp inv off plus off[ i ][ j ] specify conversion parameters for converting a depth value to a disparity value and might be used to infer the values of cp scale[ j ], cp off[ j ], cp inv scale plus scale[ j ], and cp inv off plus off[ j ] for the i-th view specified in VPS. When the i-th view contains both a texture view and a depth view, the conversion parameters are associated with the texture view.

iv mv scaling_flag equal to 1 specifies that motion vectors used for inter-view prediction in a layer with nuh_layer_id equal to layerId may be scaled based on ViewId[ layerId ] values. iv mv scaling_flag equal to 0 specifies that motion vectors used for inter-view prediction in a layer with nuh_layer_id equal to layerId are not scaled based on ViewId[ layerId ] values. When not present, the value of iv mv scaling_flag is inferred to be equal to 0.

H.7.4.3.2 Sequence parameter set RBSP semantics

The specifications in subclause G.7.4.3.2 and its subclauses apply, with the following modifications and additions:

sps_extension2_flag equal to 0 specifies that no sps_extension2( ) syntax structure is present in the SPS RBSP syntax structure. sps_extension2_flag equal to 1 specifies that the sps_extension2( ) syntax structure is present in the SPS RBSP syntax structure.

sps_extension3_flag equal to 0 specifies that no sps_extension_data_flag syntax elements are present in the SPS RBSP syntax structure. sps_extension3_flag shall be equal to 0 in bitstreams conforming to this version of this Specification. The value of 1 for sps_extension3_flag is reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore all sps_extension_data_flag syntax elements that follow the value 1 for sps_extension3_flag in an SPS NAL unit.

H.7.4.3.3 Picture parameter set RBSP semantics

The specifications in subclause G.7.4.3.3 apply with the following modifications and additions:

pps_extension2_flag equal to 0 specifies that no pps_extension_data_flag syntax elements are present in the PPS RBSP syntax structure. pps_extension2_flag shall be equal to 0 in the bitstream conforming to this version of this specification. The value 1 for pps_extension2_flag is reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore all pps_extension_data_flag syntax elements that follow the value 1 for pps_extension2_flag in a PPS NAL unit.
H.7.4.3.3.1 Picture parameter set extension semantics

dlt_present_flag equal to 1 specifies the depth lookup tables for the depth views are present in this PPS. dlt_present_flag equal to 0 specifies the depth lookup tables for the depth views are not present in this PPS.

For variables NumDepthLayers and DepthIdxToLayerIdInNuh are derived as specified in the following:

\[
\begin{align*}
\text{j} & = 0 \\
\text{for } ( \text{i} = 0; \text{i} \leq \text{MaxNumLayersMinus1}; \text{i}++) \\
\text{layerId} & = \text{LayerIdInNuh}[ \text{i} ] \\
\text{if} ( \text{VpsDepthFlag[ layerId ]}) \\
\text{DepthIdxToLayerIdInNuh[ j++ ]} & = \text{layerId} \\
\text{NumDepthLayers} & = \text{j}
\end{align*}
\]

PPS_depth_layers_minus1 plus 1 specifies the number of depth layers. pps_depth_layers_minus1 shall be equal to NumDepthLayers – 1.

PPS_bit_depth_for_depth_views_minus8 plus 8 specifies the bit depth of the samples of the depth layer.

The variable depthMaxValue is set equal to \((1 \ll (\text{pps_bit_depth_for_depth_views_minus8} + 8)) - 1\).

dlt_flag[i] equal to 1 specifies that the i-th depth lookup table is present in the PPS and used for the coding of the layer with nuh_layer_id equal to DepthIdxToLayerIdInNuh[i]. dlt_flag[i] equal to 0 specifies that a depth lookup table is not present for the layer with nuh_layer_id equal to DepthIdxToLayerIdInNuh[i]. When not present, the value of dlt_flag[i] is inferred to be equal to 0.

For i in the range of 0 to NumDepthLayers –1, the variable DltFlag[DepthIdxToLayerIdInNuh[i]] is set equal to dlt_flag[i].

inter_view_dlt_pred_enable_flag[i] equal to 1 indicates the i-th depth lookup table is predicted from the depth lookup table of the 0-th depth lookup table. \[\text{Ed. (CY): a more generic solution is to signal the reference view for DLT prediction.}\] inter_view_dlt_pred_enable_flag[i] equal to 0 indicates the i-th depth lookup table is not predicted from any other depth lookup table. The value of inter_view_dlt_pred_enable_flag[0] shall be equal to 0.

[Ed. (GT): Since flexible coding order is not allowed the 0-th DLT always belongs to the base view. See comments on derivation process below.]

dlt_bit_map_rep_flag[i] equal to 1 specifies the i-th depth lookup table is represented as bit map by the syntax elements dlt_bit_map_flag[j]. dlt_bit_map_rep_flag[i] equal to 0 specifies the i-th depth lookup table is derived from the entry table. When not present, the value of dlt_bit_map_rep_flag[i] is inferred to be equal to 0.

dlt_bit_map_flag[i][j] equal to 1 specifies that the depth value equal to j is present in the i-th depth lookup table as one entry. dlt_bit_map_flag[i][j] equal to 0 specifies that the depth value equal to j is not an entry of the depth lookup table as one entry.

The variable layerId is set equal to DepthIdxToLayerIdInNuh[i] and when dlt_bit_map_rep_flag[i] is equal to 1, the variables DltDepthValue[layerId][k] and NumDepthValuesInDlt[layerId] of the i-th depth lookup table are derived as follows:

\[
\begin{align*}
\text{k} & = 0 \\
\text{for } ( \text{j} = 0; \text{j} \leq \text{depthMaxValue}; \text{j}++) \\
\text{if} ( \text{dlt_bit_map_flag[i][j]} ) \\
\text{DltDepthValue[ layerId ][ k++] } & = \text{j} \\
\text{NumDepthValuesInDlt[ layerId ]} & = \text{k}
\end{align*}
\]

H.7.4.3.3.2 Entry table semantics

num_entry specifies the number of entries in the i-th depth lookup table. The length of num_entry syntax element is pps_bit_depth_for_depth_views_minus8 + 8 bits.

max_diff specifies the maximum difference between two consecutive entries of the i-th depth lookup table. The length of max_diff syntax element is pps_bit_depth_for_depth_views_minus8 + 8 bits. When not present, the value of max_diff is inferred to be equal to 0.

min_diff_minus1 specifies the minimum difference between two consecutive entries of the i-th depth lookup table, min_diff_minus1 is in the range of 0 to max_diff – 1, inclusive. The length of the min_diff_minus1 syntax element is Ceil(Log2(max_diff + 1)) bits. When not present, the value of min_diff_minus1 is inferred to be equal to (max_diff – 1).

The variable minDiff is set equal to (min_diff_minus1 + 1).
entry0 specifies the 0-th entry of the i-th depth lookup table. The length of the entry0 syntax element is
$ppS_{bit\_depth\_for\_depth\_views\_minus8} + 8$ bits

entry\_value\_diff\_minus\_min[k] plus minDiff specifies the difference between the k-th entry and the (k-1)-th entry
in the i-th depth lookup table. The length of entry\_value\_diff\_minus\_min[k] syntax element is
$\text{Ceil}(\log_2(\text{max\_diff} - \text{minDiff} + 1) )$ bits.

The variable entry[k] is derived as specified in the following:

```plaintext
entry[ 0 ] = entry0
for( k = 1; k < num\_entry; k++ )
  entry[k] = entry[k - 1] + entry\_value\_diff\_minus\_min[k] + minDiff
```

The variable layerId is set equal to DepthIdxToLayerIdInNuh[i] and the variable baseDepthLayerId is set equal to
DepthIdxToLayerIdInNuh[0].

Depending on inter\_view\_dlt\_pred\_enable\_flag[i] the variables DltDepthValue[layerId][k] and
NumDepthValueInDlt[layerId] of the i-th depth lookup table are derived as specified in the following:

- If if inter\_view\_dlt\_pred\_enable\_flag[i] is equal to 0, the following applies:
  ```plaintext
  NumDepthValueInDlt[layerId] = num\_entry
  for( j = 0; j < num\_entry; j++ )
    DltDepthValue[layerId][j] = entry[j]
  ```

- Otherwise (inter\_view\_dlt\_pred\_enable\_flag[i] is equal to 1), the following applies:
  ```plaintext
  for( j = 0, k = 0; j < depth\_Max\_Value && k < NumDepthValueInDlt[baseDepthLayerId]; j++ ) {
    dltRefBitMapFlag[j] = 0
    if( DltDepthValue[baseDepthLayerId][k] == j ) {
      dltRefBitMapFlag[j] = 1
      k++
    }
  }
  ```

[H.7.4.3.4 Supplemental enhancement information RBSP semantics]
The specifications in subclause G.7.4.3.4 apply.

[H.7.4.3.5 Access unit delimiter RBSP semantics]
The specifications in subclause G.7.4.3.5 apply.

[H.7.4.3.6 End of sequence RBSP semantics]
The specifications in subclause G.7.4.3.6 apply.

[H.7.4.3.7 End of bitstream RBSP semantics]
The specifications in subclause G.7.4.3.7 apply.

[H.7.4.3.8 Filler data RBSP semantics]
The specifications in subclause G.7.4.3.8 apply.
H.7.4.3.9  Slice layer RBSP semantics
The specifications in subclause G.7.4.3.9 apply.

H.7.4.3.10  RBSP slice trailing bits semantics
The specifications in subclause G.7.4.3.10 apply.

H.7.4.3.11  RBSP trailing bits semantics
The specifications in subclause G.7.4.3.11 apply.

H.7.4.3.12  Byte alignment semantics
The specifications in subclause G.7.4.3.12 apply.

H.7.4.4  Profile, tier and level semantics
The specifications in subclause G.7.4.4 apply.

H.7.4.5  Scaling list
The specifications in subclause G.7.4.5 apply.

H.7.4.6  Supplemental enhancement information message semantics
The specifications in subclause G.7.4.6 apply.

H.7.4.7  Slice segment header semantics
H.7.4.7.1  General slice segment header semantics
The specification in subclause G.7.4.7.1 apply with the following modifications and additions.

- The variable DepthFlag is set equal to VpsDepthFlag[ nuh_layer_id ] and the variable ViewIdx is set equal to ViewOrderIdx[ nuh_layer_id ].

- five_minus_max_num_merge_cand specifies the maximum number of merging MVP candidates supported in the slice subtracted from 5.

- The variable NumExtraMergeCand is derived as specified in the following:
  
  \[ \text{NumExtraMergeCand} = \text{iv_mv_pred_flag}[ \text{nuh_layer_id}] || \text{mpi_flag}[ \text{nuh_layer_id}] \]  

  (H-12)

- The maximum number of merging MVP candidates, MaxNumMergeCand is derived as follows:
  
  \[ \text{MaxNumMergeCand} = 5 - \text{five_minus_max_num_merge_cand} + \text{NumExtraMergeCand} \]  

  (H-13)

- The value of MaxNumMergeCand shall be in the range of 1 to \((5 + \text{NumExtraMergeCand})\), inclusive.

- slice_ic_enable_flag equal to 1 specifies illumination compensation is enabled for the current slice. slice_ic_enable_flag equal to 0 specifies that illumination compensation is disabled for the current slice. When not present, slice_ic_enable_flag is inferred to be equal to 0.

- slice_ic_disable_merge_zero_idx_flag equal to 1 specifies that ic_flag is not present in the coding units with partitioning mode equal to PART_2Nx2N of the current slice when merge_flag is equal to 1 and merge_idx of the prediction unit in the coding unit is equal to 0. slice_ic_disable_merge_zero_idx_flag equal to 0 specifies that ic_flag might be present in the coding units with partitioning mode equal to PART_2Nx2N of the current slice when merge_flag is equal to 1 and merge_idx of the prediction unit in the coding unit is equal to 0. When not present, slice_ic_disable_merge_zero_idx_flag is inferred to be equal to 0.

- cp_scale[ j ], cp_off[ j ], cp_inv_scale_plus_scale[ j ], and cp_inv_off_plus_off[ j ] specify conversion parameters for converting a depth value to a disparity value. When not present, the values of cp_scale[ j ], cp_off[ j ], cp_inv_scale_plus_scale[ j ], and cp_inv_off_plus_off[ j ] are inferred to be equal to vps_cp_scale[ ViewIdx ][ j ], vps_cp_off[ ViewIdx ][ j ], vps_cp_inv_scale_plus_scale[ ViewIdx ][ j ], and vps_cp_inv_off_plus_off[ ViewIdx ][ j ], respectively. It is a requirement of bitstream conformance, that the values of cp_scale[ j ], cp_off[ j ], cp_inv_scale_plus_scale[ j ], and cp_inv_off_plus_off[ j ] in a slice segment header having a ViewIdx equal to viewIdxA and the values of cp_scale[ j ], cp_off[ j ], cp_inv_scale_plus_scale[ j ], and cp_inv_off_plus_off[ j ] in a slice segment header having a ViewIdx equal to viewIdxB shall be the same, when viewIdxA is equal to viewIdxB.

- DepthToDisparityB[ j ][ d ] specifying the disparity between the current view and the view with ViewIdx
equal \( j \) corresponding to the depth value \( d \) in the view with \( \text{ViewIdx} = j \) and the array \( \text{DepthToDisparityF}[[ j ][ d ]] \) specifying the disparity between the view with \( \text{ViewIdx} = j \) and the current view corresponding to the depth value \( d \) in the current view is derived as specified in the following:

- The variable \( \log2\text{Div} \) is set equal to \( \text{BitDepth}_Y - 1 + \text{cp\textunderscore precision} \).
- For \( d \) in range of 0 to \( (1 << \text{BitDepth}_Y) - 1 \), inclusive, the following applies:
  - For \( i \) in the range of 0 to \( \text{ViewIdx} - 1 \), inclusive, the following applies:
    - \( \text{offset} = (\text{cp\textunderscore off}[ j ] << \text{BitDepth}_Y) + (1 << \log2\text{Div}) >> 1 \) \( \text{(H-14)} \)
    - \( \text{scale} = \text{cp\textunderscore scale}[ j ] \) \( \text{(H-15)} \)
    - \( \text{DepthToDisparityB}[[ j ][ d ]] = (\text{scale} \ast d + \text{offset}) >> \log2\text{Div} \) \( \text{(H-16)} \)
    - \( \text{invOffset} = ((\text{cp\textunderscore inv\textunderscore off}[ j ] - \text{cp\textunderscore off}[ j ]) << \text{BitDepth}_Y) + (1 << \log2\text{Div}) >> 1 \) \( \text{(H-17)} \)
    - \( \text{invScale} = (\text{cp\textunderscore inv\textunderscore scale}[ j ] - \text{cp\textunderscore scale}[ j ]) \) \( \text{(H-18)} \)
    - \( \text{DepthToDisparityF}[[ j ][ d ]] = (\text{invScale} \ast d + \text{invOffset}) >> \log2\text{Div} \) \( \text{(H-19)} \)

H.7.4.7.2  Reference picture list modification semantics

The specifications in subclause G.7.4.5.2 apply.

H.7.4.8  Short-term reference picture set semantics

The specifications in subclause G.7.4.8 apply.

H.7.4.9  Slice data semantics

H.7.4.9.1  Slice data semantics

The specifications in subclause 7.4.9.1 apply.

H.7.4.9.2  Coding tree unit semantics

The specifications in subclause 7.4.9.2 apply, with the following modifications and additions.

Let \( \text{DepthPic} \) be the picture in the current access unit with \( \text{ViewIdx}(\text{DepthPic}) \) equal to \( \text{ViewIdx} \) and \( \text{DepthFlag}(\text{DepthPic}) \) equal to 1.

Let \( \text{TexturePic} \) be the picture in the current access unit with \( \text{ViewIdx}(\text{TexturePic}) \) equal to \( \text{ViewIdx} \) and \( \text{DepthFlag}(\text{TexturePic}) \) equal to 0.

The arrays \( \text{TextureCtDepth} \), \( \text{TexturePartMod} \), \( \text{TexturePredMode} \), and \( \text{TextureIntraPredModeY} \) are set equal to the arrays \( \text{CtDepth} \), \( \text{CtPartMode} \), \( \text{PredMode} \), and \( \text{IntraPredModeY} \) of \( \text{TexturePic} \), respectively.

H.7.4.9.3  Sample adaptive offset semantics

The specification in subclause 7.4.9.3 apply.

H.7.4.9.4  Coding quadtree semantics

The specifications in subclause 7.4.9.4 apply.

The variable \( \text{predSplitCuFlag} \) specifying whether the \( \text{split\_cu\_flag} \) is predicted by inter-component prediction is derived as specified in the following.

- If \( \text{slice\_type} \) is not equal to I, \( \text{RapPicFlag} \) is equal to 0, and \( \text{lim\_qt\_pred\_flag}[\text{nuh\_layer\_id}] \) is equal to 1, \( \text{predSplitCuFlag} \) is set equal to (\( \text{TextureCtDepth}[x0][y0] \leq \text{ctDepth} \))
- Otherwise (\( \text{slice\_type} \) is equal to I or \( \text{RapPicFlag} \) is equal to 1 or \( \text{lim\_qt\_pred\_flag}[\text{nuh\_layer\_id}] \) is equal to 0), \( \text{predSplitCuFlag} \) is set equal to 0.

\( \text{split\_cu\_flag}[x0][y0] \) specifies whether a coding unit is split into coding units with half horizontal and vertical size. The array indices \( x0, y0 \) specify the location \( (x0, y0) \) of the top-left luma sample of the considered coding block relative to the top-left luma sample of the picture.

When \( \text{split\_cu\_flag}[x0][y0] \) is not present, the following applies:

- If \( \log2\text{CbSize} \) is greater than \( \text{MinCbLog2SizeY} \) \text{and}\( \text{predSplitCuFlag} \) is equal to 0, the value of \( \text{split\_cu\_flag}[x0][y0] \) is inferred to be equal to 1.
the value of split_cu_flag[ x0 ][ y0 ] is inferred to be equal to 0.

H.7.4.9.5  
Coding unit semantics

The specification in subclause 7.4.9.5 apply with the following modifications and additions:

- If slice_type is not equal to I, RapPicFlag is equal to 0 and lim_qt_pred_flag[ nuh_layer_id ] is equal to 1, the variable predPartModeFlag specifying whether part_mode is predicted by inter-component prediction is derived as follows.

\[
\text{predPartModeFlag} = \begin{cases} 
\text{TextureCtDepth}[ x0 ][ y0 ] = = \text{ctDepth} \quad \&\& \quad (\text{TexturePartMode}[ x0 ][ y0 ] ! = \text{PART_NxN} ) & (H-20) \\
\text{Otherwise (slice_type is equal to I or RapPicFlag is equal to 1 or lim_qt_pred_flag[ nuh_layer_id ] is equal to 0), predPartModeFlag is set equal to 0.} 
\end{cases}
\]

- \text{iv_res_pred_weight_idx} specifies the index of the weighting factor used for residual prediction. \text{iv_res_pred_weight_idx} equal to 0 specifies that residual prediction is not used for the current coding unit. \text{iv_res_pred_weight_idx} not equal to 0 specifies that residual prediction is used for the current coding unit. When not present, the value of \text{iv_res_pred_weight_idx} is inferred to be equal to 0.

When DefaultDispFlag[ x0 ][ y0 ] is equal to 1, \text{iv_res_pred_weight_idx} shall be equal to 0.

The variable icEnableFlag is set equal to 0 and when slice_ic_enable_flag is equal to 1 and PartMode[ x0 ][ y0 ] is not equal to MODE_INTRA, the following applies:

- If merge_flag[ x0 ][ y0 ] is equal to 1, the following applies:

\[
\text{icEnableFlag} = ( \text{merge_idx}[ x0 ][ y0 ] != 0 ) \quad \&\& \quad \text{!slice_ic_disable_merge_zero_idx_flag} \quad (H-21)
\]

- Otherwise ( merge_flag[ x0 ][ y0 ] is equal to 0 ), the following applies:

  - With \( X \) being replaced by 0 and \( I \), the variable refViewIdxLX is set equal to ViewIdx( RefPicListLX[ ref_idx_LX[ x0 ][ y0 ] ] ).
  
  - The flag icEnableFlag is derived as specified in the following:

\[
\text{icEnableFlag} = \begin{cases} 
(\text{inter_pred_idc}[ x0 ][ y0 ] != \text{Pred_L0} \quad \&\& \quad \text{refViewIdxL1} != \text{ViewIdx}) \quad | | \\
(\text{inter_pred_idc}[ x0 ][ y0 ] != \text{Pred_L1} \quad \&\& \quad \text{refViewIdxL0} != \text{ViewIdx}) & (H-22)
\end{cases}
\]

\text{ic_flag} equal to 1 specifies illumination compensation is used for the current coding unit. \text{ic_flag} equal to 0 specifies illumination compensation is not used for the current coding unit. When not present, \text{ic_flag} is inferred to be equal to 0.

\text{inter_sdc_flag} equal to 1 specifies simplified depth coding of residual blocks is used for the current coding unit. \text{inter_sdc_flag} equal to 0 specifies simplified depth coding of residual blocks is not used for the current coding unit. When not present, \text{inter_sdc_flag} is inferred to be equal to 0.

\text{inter_sdc_resi_abs_minus1}[ x0 ][ y0 ][ i ] \text{, inter_sdc_resi_sign_flag[ x0 ][ y0 ][ i ]} \text{ are used to derive InterSdcResi[ x0 ][ y0 ][ i ] as follows:}

\[
\text{InterSdcResi}[ x0 ][ y0 ][ i ] = (1 - 2 \times \text{inter_sdc_resi_sign_flag}[ x0 ][ y0 ][ i ] \times ( \text{inter_sdc_resi_abs_minus1}[ x0 ][ y0 ][ i ] + 1 )) 
\]

\text{rgt_root_cbf} equal to 1 specifies that the transform_tree( ) syntax structure is present for the current coding unit. \text{rgt_root_cbf} equal to 0 specifies that the transform_tree( ) syntax structure is not present for the current coding unit.

When DepthFlag is equal to 0, for use in derivation processes of variables invoked later in the decoding process, the following assignments are made for \( x = x0..x0 + (1 \ll \text{log2cbSize}) - 1, y = y0..y0 + (1 \ll \text{log2cbSize}) - 1:

\[
\begin{align*}
\text{CtDepth}[ x ][ y ] &= \text{ctDepth} \\
\text{CtPartMode}[ x ][ y ] &= \text{PartMode} \\
\text{CbSize}[ x ][ y ] &= (1 \ll \text{log2cbSize}) \\
\text{CbPosX}[ x ][ y ] &= x0 \\
\text{CbPosY}[ x ][ y ] &= y0
\end{align*}
\]

When DepthFlag is equal to 0, for use in derivation processes of variables invoked later in the decoding process, the following assignments are made for \( x = x0..x0 + (1 \ll \text{log2cbSize}) - 1, y = y0..y0 + (1 \ll \text{log2cbSize}) - 1:

\[
\begin{align*}
\text{CtDepth}[ x ][ y ] &= \text{ctDepth} \\
\text{CtPartMode}[ x ][ y ] &= \text{PartMode} \\
\text{CbSize}[ x ][ y ] &= (1 \ll \text{log2cbSize}) \\
\text{CbPosX}[ x ][ y ] &= x0 \\
\text{CbPosY}[ x ][ y ] &= y0
\end{align*}
\]
H.7.4.9.5.1 Depth mode parameter semantics

The variable Log2MaxDmmCbSize is set equal to 5.

The variables depthIntraModeSet is derived as specified in the following:

- If log2CbSize is equal to 6, depthIntraModeSet is set equal to 0.
- Otherwise, if log2CbSize is equal to 3 and PartMode[ xC ][ yC ] is equal to PART_NxN, depthIntraModeSet is set equal to 1.
- Otherwise, depthIntraModeSet is set equal to 2.

**depth_intra_mode[ ]** specifies the depth intra mode of the current prediction unit. Table H-2 specifies the value of the variable depthIntraModeMaxLen depending on depthIntraModeSet and the value of the variable DepthIntraMode and the associated name depending on the on depth_intra_mode and depthIntraModeSet.

The variable SdcFlag[ x0 ][ y0 ] is derived as specified in the following:

\[
\text{SdcFlag[ x0 ][ y0 ] = ( DepthIntraMode[ x0 ][ y0 ] = = \text{INTRA_DEP_SDC_PLANAR} ) || ( DepthIntraMode[ x0 ][ y0 ] = = \text{INTRA_DEP_SDC_DMM_WFULL} )}
\]

(H-29)

The variable DmmFlag[ x0 ][ y0 ] is derived as specified in the following:

\[
\text{DmmFlag[ x0 ][ y0 ] = ( DepthIntraMode[ x0 ][ y0 ] = = \text{INTRA_DEP_DMM_WFULL} ) || ( DepthIntraMode[ x0 ][ y0 ] = = \text{INTRA_DEP_DMM_CPREDTEX} )}
\]

(H-30)

<table>
<thead>
<tr>
<th>depthIntraModeSet</th>
<th>0</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>depthIntraModeMaxLen</td>
<td>1</td>
<td>3</td>
<td>3</td>
</tr>
</tbody>
</table>

Table H-2 – Specification of DepthIntraMode and associated name depending on depthIntraModeSet and depth_intra_mode and specification of and depthIntraModeMaxLen depending on depthIntraModeSet

**wedge_full_tab_idx[ ]** specifies the index of the wedgelet pattern in the corresponding pattern list when DepthIntraMode[ x0 ][ y0 ] is equal to INTRA_DEP_DMM_WFULL.

depth_dc_flag[ x0 ][ y0 ] equal to 1 specifies that depth_dc_abs[ x0 ][ y0 ][ i ] and depth_dc_sign_flag[ x0 ][ y0 ][ i ] are present. depth_dc_flag[ x0 ][ y0 ] equal to 0 specifies that depth_dc_abs[ x0 ][ y0 ][ i ] and depth_dc_sign_flag[ x0 ][ y0 ][ i ] are not present.

depth_dc_abs[ x0 ][ y0 ][ i ], depth_dc_sign_flag[ x0 ][ y0 ][ i ] are used to derive DcOffset[ x0 ][ y0 ][ i ] as follows:

\[
\text{DcOffset[ x0 ][ y0 ][ i ] = ( 1 - 2 \ast \text{depth_dc_sign_flag[ x0 ][ y0 ][ i ]} \ast ( \text{depth_dc_abs[ x0 ][ y0 ][ i ] - dcNumSeg + 2 )}}
\]

(H-31)

H.7.4.9.6 Prediction unit semantics

The specifications in subclause 7.4.9.6 apply.

H.7.4.9.7 PCM sample semantics

The specifications in subclause 7.4.9.7 apply.

H.7.4.9.8 Transform tree semantics

The specifications in subclause 7.4.9.8 apply.

H.7.4.9.9 Motion vector difference coding semantics

The specifications in subclause 7.4.9.9 apply.
3D-HEVC

H.7.4.9.10  Transform unit semantics
The specifications in subclause 7.4.9.10 apply.

H.7.4.9.11  Residual coding semantics
The specifications in subclause 7.4.9.11 apply.
H.8 Decoding process

H.8.1 General decoding process
The specifications in subclause F.8.1 apply with the following modifications:

- "ViewScalExtLayerFlag[ nuh_layer_id ] is equal to 1" is replaced by "ViewScalExtLayerFlag[ nuh_layer_id ] is equal to 1 or VpsDepthFlag[ nuh_layer_id ] is equal to 1"

- All invocations of the process specified in subclause G.8.1 are replaced with invocations of the process specified in subclause H.8.1.1.

H.8.1.1 Decoding process for a coded picture with nuh_layer_id greater than 0
The decoding process operates as follows for the current picture CurrPic:

1. The decoding of NAL units is specified in subclause G.8.2.
2. The processes in subclause G.8.1.2 and G.8.3.4 specify the following decoding processes using syntax elements in the slice segment layer and above:
   - Prior to decoding the first slice of the current picture, subclause G.8.1.2 is invoked.
   - At the beginning of the decoding process for each P or B slice, the decoding process for reference picture lists construction specified in subclause G.8.3.4 is invoked for derivation of reference picture list 0 (RefPicList0), and when decoding a B slice, reference picture list 1 (RefPicList1).
   - When iv_mv_pred_flag[ nuh_layer_id ] is equal to 1 or iv_res_pred_flag[ nuh_layer_id ] is equal to 1, the decoding process for candidate picture list for disparity vector derivation in subclause H.8.3.5 is invoked at the beginning of the decoding process for each P or B slice. [Ed. (GT): VSP should be added here as condition.]
   - At the beginning of the decoding process for each P or B slice, the derivation process for the alternative target reference index for TMVP in merge mode as specified in subclause H.8.3.7 is invoked.
   - At the beginning of the decoding process for each P or B slice, the derivation process for the default reference view order index for disparity derivation as specified in subclause H.8.3.8 is invoked.
   - When iv_res_pred_flag[ layerId ] is equal to 1, the derivation process for the target reference index for residual prediction as specified in subclause H.8.3.9 is invoked, at the beginning of the decoding process for each P or B slice.
   - When DltFlag[ nuh_layer_id ] is equal to 1, the decoding process for the depth lookup table in subclause H.8.3.6 is invoked at the beginning of the decoding process of first slice.
3. The processes in subclauses H.8.3.8, H.8.5, H.8.3.6, and H.8.7 specify decoding processes using syntax elements in all syntax structure layers. It is a requirement of bitstream conformance that the coded slices of the picture shall contain slice segment data for every coding tree unit of the picture, such that the division of the picture into slices, the division of the slices into slice segments, and the division of the slice segments into coding tree units each form a partitioning of the picture.
4. After all slices of the current picture have been decoded, the marking process for ending the decoding of a coded picture with nuh_layer_id greater than 0 specified in subclause G.8.1.3 is invoked.

H.8.2 NAL unit decoding process
The specification in subclause G.8.2 apply.

H.8.3 Slice decoding process

H.8.3.1 Decoding process for picture order count
The specifications in subclause G.8.3.1 apply.

H.8.3.2 Decoding process for reference picture set
The specifications in subclause G.8.3.2 apply.

H.8.3.3 Decoding process for generating unavailable reference pictures
The specifications in subclause G.8.3.3 apply.
H.8.3.4 Decoding process for reference picture lists construction
The specifications in subclause G.8.3.4 apply.

H.8.3.5 Derivation process for the candidate picture list for disparity vector derivation

[Ed. (GT): This algorithm is different from the algorithm in software. However, it seems to be equivalent.]

The variable NumDdvCandPics is set equal to 0 and the candidate picture list DdvCandPicList with a number of NumDdvCandPics elements is constructed as follows.

When slice_temporal_mvp_enabled_flag is equal to 1 the following ordered steps apply:

1. DdvCandPicList[0] is set equal to RefPicListX[collocated_ref_idx], with X equal to (1 – collocated_from_l0_flag), and NumDdvCandPics is set equal to 1.
2. The variable lowestTemporalIdRefs is set equal to 7.
3. NumDdvCandPics, DdvCandPicList[1] and lowestTemporalIdRefs are derived as specified in the following:
   
   for ( dir = 0; dir < 2 ; dir++) {
      X = dir ? collocated_from_l0_flag : (1 – collocated_from_l0_flag)
      for (i = 0; i <= num_ref_idx_lX_default_active_minus1; i++) {
         if (ViewIdx == ViewIdx(RefPicListX[i]) &amp; (X == collocated_from_l0_flag || i != collocated_ref_idx)
            &amp; (NumDdvCandPics != 2)) {
            if (RefPicListX[i] is a random access view component) {
               DdvCandPicsList[1] = RefPicListX[i]
               NumDdvCandPics = 2
            } else if (lowestTemporalIdRefs > TemporalId of RefPicListX[i]) {
               lowestTemporalIdRefs = TemporalId of RefPicListX[i]
            }
         }
      }
   }

4. When NumDdvCandPics is equal to 1, the following applies:
   
   pocDistance = 255
   for (dir = 0; dir < 2; dir++) {
      X = dir ? collocated_from_l0_flag : (1 – collocated_from_l0_flag)
      for (i = 0; i <= num_ref_idx_lX_default_active_minus1; i++) {
         if (ViewIdx == ViewIdx(RefPicListX[i]) &amp; (X == collocated_from_l0_flag || i != collocated_ref_idx)
            &amp; (TemporalId of RefPicListX[i] == lowestTemporalIdRefs)
            &amp; (Abs(PicOrderCntVal – PicOrderCnt(RefPicListX[i])) < pocDistance)) {
            pocDistance = Abs(PicOrderCntVal – PicOrderCnt(RefPicListX[i]))
            Z = X
            idx = i
         }
      }
   } if (pocDistance < 255) {
      NumDdvCandPics = 2
   }

H.8.3.6 Decoding process for a depth lookup table

This process is only invoked when DltFlag[nuh_layer_id] is equal to 1.

The list elements Idx2DepthValue[i] specifying the depth value of the i-th index in the lookup table with i ranging from 0 to NumDepthValuesInDlt[nuh_layer_id] – 1, inclusive is derived as follows.

- For i in the range of 0 to NumDepthValuesInDlt[nuh_layer_id] – 1, inclusive, the elements in Idx2DepthValue are derived as follows:
  - Idx2DepthValue[i] is set equal to DltDepthValue[nuh_layer_id][i]

The list elements DepthValue2Idx[d] specifying the index of depth values d in the lookup table with d ranging from 0
to BitDepthY − 1, inclusive are derived as specified in the following:

```c
for (d = 0; d < BitDepthY; d++) {
    idxLower = 0
    for (iL = 1, foundFlag = 0; iL < NumDepthValuesInDtl[ nuh_layer_id ] && !foundFlag; iL++)
        if( Idx2DepthValue[ iL ] > d ) {
            idxLower = iL − 1
            foundFlag = 1
        }
    idxUpper = NumDepthValuesInDtl[ nuh_layer_id ] − 1
    for( iU = NumDepthValuesInDtl[ nuh_layer_id ] − 2, foundFlag = 0; iU >= 0 && !foundFlag; iU++ )
        if ( Idx2DepthValue[ iU ] < d ) {
            idxUpper = iU + 1
            foundFlag = 1
        }
    if( Abs( d − Idx2DepthValue[ idxLower ] ) < Abs ( d − Idx2DepthValue[ idxUpper ] ) )
        DepthValue2Idx[ d ] = idxLower
    else
        DepthValue2Idx[ d ] = idxUpper
}
```

H.8.3.7 Derivation process for the alternative target reference index for TMVP in merge mode

This process is invoked when the current slice is a P or B slice.

The variables AltRefIdxL0 and AltRefIdxL1 are set equal to −1 and the following applies for X in the range of 0 to 1, inclusive:

- When X is equal to 0 or the current slice is a B slice the following applies:
  
  ```c
  zeroIdxLtFlag = RefPicListX[ 0 ] is a short-term reference picture ? 0 : 1
  for( i = 1; i <= num_ref_idx_lX_active_minus1 && AltRefIdxLX = = −1; i++)
      if( ( zeroIdxLtFlag && RefPicListX[ i ] is a short-term reference picture ) ||
          ( !zeroIdxLtFlag && RefPicListX[ i ] is a long-term reference picture ) )
          AltRefIdxLX = i
  ```

H.8.3.8 Derivation process for the default reference view order index for disparity derivation

This process is invoked when the current slice is a P or B slice.

The variable DefaultViewIdx is set equal to −1, and the following applies for curViewIdx in the range of 0 to ( ViewIdx − 1 ), inclusive:

- The following applies for X in the range of 0 to 1, inclusive:
  - When X is equal to 0 or the current slice is a B slice, the following applies for i in the range of 0 to NumRefPicsLX, inclusive:
    - When all of the following conditions are true, DefaultViewIdx is set equal to curViewIdx.
      - DefaultViewIdx is equal to −1.
      - ViewIdx( RefPicListX[ i ] ) is equal to curViewIdx.
      - PicOrderCnt( RefPicListX[ i ] ) is equal to PicOrderCntVal.

H.8.3.9 Derivation process for the target reference index for residual prediction

This process is invoked when the current slice is a P or B slice.

The variables RpRefIdxL0 and RpRefIdxL1 are set equal to −1, the variables RpRefPicAvailFlagL0 and RpRefPicAvailFlagL1 are set equal to 0.

The following applies for X in the range of 0 to 1, inclusive:

- When X is equal to 0 or the current slice is a B slice the following applies:
  - For i in the range of 0 to num_ref_idx_lX_active_minus1, inclusive, the following applies:
    - When PicOrderCnt( RefPicListX[ i ] ) is not equal to PicOrderCntVal and RpRefPicAvailFlagLX is equal to 0, the following applies:
      ```c
      RpRefIdxLX = i
      ```

(H-32)
3D-HEVC

RpRefPicAvailFlagLX = 1

[Ed. (GT): There might be pictures present in the DPB fulfilling the above conditions, but having e.g. a different value of DepthFlag compared to the current layer.]

The variable RpRefPicAvailFlagLX is set equal to ( RpRefPicAvailFlagL0 || RpRefPicAvailFlagL1 ).

When RpRefPicAvailFlag is equal to 1, the following applies for X in the range of 0 to 1, inclusive:

- When X is equal to 0 or the current slice is a B slice the following applies:
  - For i in the range of 0 to NumActiveRefLayerPics − 1, inclusive, the following applies:
    - The variable refViewIdx is set equal to ViewIdx( RefPicListX[ i ] ).
    - The variable RefRpRefAvailFlagLX[ refViewIdx ] is set equal to 0.
    - When RpRefPicAvailFlagLX is equal to 1 and there is a picture picA in the DPB with PicOrderCnt( picA ) equal to PicOrderCnt( RefPicListX[ RpRefIdxLX ] ), ViewIdx( picA ) equal to refViewIdx, DepthFlag( picA ) equal to 0 and marked as “used for reference”, RefRpRefAvailFlagLX[ refViewIdx ] is set equal to 1.

H.8.4 Decoding process for coding units coded in intra prediction mode

H.8.4.1 General decoding process for coding units coded in intra prediction mode

The specifications in subclause 8.4.1 apply with the following modification:

- All invocations of the process specified in subclause 8.4.2 are replaced with invocations of the process specified in subclause H.8.4.2.
- All invocations of the process specified in subclause 8.4.4.1 are replaced with invocations of the process specified in subclause H.8.4.4.1.

H.8.4.2 Derivation process for luma intra prediction mode

Input to this process is a luma location (xpB, ypB ) specifying the top-left sample of the current luma prediction block relative to the top left luma sample of the current picture.

In this process, the luma intra prediction mode IntraPredModeY[ xpB ][ ypB ] is derived.

Table H-3 specifies the value for the intra prediction mode and the associated names.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

IntraPredModeY[ xpB ][ ypB ] labelled 0..34 represents directions of predictions as illustrated in Figure 8 1.

- If DepthIntraMode[ xpB ][ ypB ] is equal to INTRA_DEP_SDC_PLANAR, IntraPredModeY[ xpB ][ ypB ] is set equal to INTRA_PLANAR.
- Otherwise, if DepthIntraMode[ xpB ][ ypB ] is equal to INTRA_DEP_SDC_DMM_WFULL, IntraPredModeY[ xpB ][ ypB ] is set equal to INTRA_DMM_WFULL.
- Otherwise, if DepthIntraMode[ xpB ][ ypB ] is equal to INTRA_DEP_DMM_WFULL, IntraPredModeY[ xpB ][ ypB ] is set equal to INTRA_DMM_WFULL.
- Otherwise, if DepthIntraMode[ xpB ][ ypB ] is equal to INTRA_DEP_DMM_CPREDTEX, IntraPredModeY[ xpB ][ ypB ] is set equal to INTRA_DMM_CPREDTEX.
- Otherwise ( DepthIntraMode[ xpB ][ ypB ] is equal to INTRA_DEP_NONE ), IntraPredModeY[ xpB ][ ypB ] is
derived as the following ordered steps:

1. The neighbouring locations \((x_{NbA}, y_{NbA})\) and \((x_{NbB}, y_{NbB})\) are set equal to \((x_{Pb} - 1, y_{Pb})\) and \((x_{Pb}, y_{Pb} - 1)\), respectively.

2. For X being replaced by either A or B, the variables \(\text{candIntraPredModeX}\) are derived as follows:
   - The availability derivation process for a block in z-scan order as specified in subclause 6.4.2 is invoked with the location \((x_{Curr}, y_{Curr})\) set equal to \((x_{Pb}, y_{Pb})\) and the neighbouring location \((x_{NbY}, y_{NbY})\) set equal to \((x_{NbX}, y_{NbX})\) as inputs, and the output is assigned to \(\text{availableX}\).
   - The candidate intra prediction mode \(\text{candIntraPredModeX}\) is derived as follows:
     - If \(\text{availableX}\) is equal to FALSE, \(\text{candIntraPredModeX}\) is set equal to INTRA_DC.
     - Otherwise, if \(\text{CuPredMode}[x_{NbX}][y_{NbX}]\) is not equal to MODE_INTRA or \(\text{pcm_flag}[x_{NbX}][y_{NbX}]\) is equal to 1, \(\text{candIntraPredModeX}\) is set equal to INTRA_DC.
     - Otherwise, if \(X\) is equal to B and \(y_{Pb} - 1\) is less than \((y_{Pb} >> \text{CtbLog2SizeY}) << \text{CtbLog2SizeY}\), \(\text{candIntraPredModeB}\) is set equal to INTRA_DC.
     - Otherwise, if \(\text{candIntraPredModeX}\) is larger than 34, \(\text{candIntraPredModeX}\) is set equal to INTRA_DC.
     - Otherwise, \(\text{candIntraPredModeX}\) is set equal to \(\text{IntraPredModeY}[x_{NbX}][y_{NbX}]\).

3. The \(\text{candModeList}[x]\) with \(x = 0..2\) is derived as follows:
   - If \(\text{candIntraPredModeB}\) is equal to \(\text{candIntraPredModeA}\), the following applies:
     - If \(\text{candIntraPredModeA}\) is less than 2 (i.e. equal to INTRA_PLANAR or INTRA_DC), \(\text{candModeList}[x]\) with \(x = 0..2\) is derived as follows:
       - \(\text{candModeList}[0] = \text{INTRA_PLANAR}\) \((H-34)\)
       - \(\text{candModeList}[1] = \text{INTRA_DC}\) \((H-35)\)
       - \(\text{candModeList}[2] = \text{INTRA_ANGLE26}\) \((H-36)\)
     - Otherwise, \(\text{candModeList}[x]\) with \(x = 0..2\) is derived as follows:
       - \(\text{candModeList}[0] = \text{candIntraPredModeA}\) \((H-37)\)
       - \(\text{candModeList}[1] = 2 + ((\text{candIntraPredModeA} + 29) \% 32)\) \((H-38)\)
       - \(\text{candModeList}[2] = 2 + ((\text{candIntraPredModeA} - 2 + 1) \% 32)\) \((H-39)\)
   - Otherwise (\(\text{candIntraPredModeB}\) is not equal to \(\text{candIntraPredModeA}\)), the following applies:
     - \(\text{candModeList}[0]\) and \(\text{candModeList}[1]\) are derived as follows:
       - \(\text{candModeList}[0] = \text{candIntraPredModeA}\) \((H-40)\)
       - \(\text{candModeList}[1] = \text{candIntraPredModeB}\) \((H-41)\)
     - If neither of \(\text{candModeList}[0]\) and \(\text{candModeList}[1]\) is equal to INTRA_PLANAR, \(\text{candModeList}[2]\) is set equal to INTRA_PLANAR,
     - Otherwise, if neither of \(\text{candModeList}[0]\) and \(\text{candModeList}[1]\) is equal to INTRA_DC, \(\text{candModeList}[2]\) is set equal to INTRA_DC,
     - Otherwise, \(\text{candModeList}[2]\) is set equal to INTRA_ANGLE26.

4. \(\text{IntraPredModeY}[x_{Pb}][y_{Pb}]\) is derived by applying the following procedure:
   - If \(\text{prev_intra_luma_pred_flag}[x_{Pb}][y_{Pb}]\) is equal to 1, the \(\text{IntraPredModeY}[x_{Pb}][y_{Pb}]\) is set equal to \(\text{candIntraPredModeY}[\text{mpm_idx}]\).
   - Otherwise, \(\text{IntraPredModeY}[x_{Pb}][y_{Pb}]\) is derived by applying the following ordered steps:
     1) The array \(\text{candModeList}[x], x = 0..2\) is modified as the following ordered steps:
        i. When \(\text{candModeList}[0]\) is greater than \(\text{candModeList}[1]\), both values are swapped as follows:
           \(\text{candModeList}[0], \text{candModeList}[1] = \text{Swap}(\text{candModeList}[0], \text{candModeList}[1])\) \((H-42)\)
        ii. When \(\text{candModeList}[0]\) is greater than \(\text{candModeList}[2]\), both values are swapped as follows:
( candModeList[0], candModeList[2] ) = Swap( candModeList[0], candModeList[2] )  \ (H-43)

iii. When candModeList[1] is greater than candModeList[2], both values are swapped as follows:

2) IntraPredModeY[ xPb ][ yPb ] is derived by the following ordered steps:
   i. IntraPredModeY[ xPb ][ yPb ] is set equal to rem_intra_luma_pred_mode[ xPb ][ yPb ].
   ii. For i equal to 0 to 2, inclusive, when IntraPredModeY[ xPb ][ yPb ] is greater than or equal to
candModeList[ i ], the value of IntraPredModeY[ xPb ][ yPb ] is incremented by one.

H.8.4.3 Derivation process for chroma intra prediction mode
The specifications in subclause 8.4.3 apply.

H.8.4.4 Decoding process for intra blocks
H.8.4.4.1 General decoding process for intra blocks

Inputs to this process are:
- a sample location ( xTb0, yTb0 ) specifying the top-left sample of the current transform block relative to the top-left sample of the current picture,
- a variable log2TrafoSize specifying the size of the current transform block,
- a variable trafoDepth specifying the hierarchy depth of the current block relative to the coding unit,
- a variable predModeIntra specifying the intra prediction mode,
- a variable cIdx specifying the colour component of the current block.

Output of this process is a modified reconstructed picture before deblocking filtering.

The luma sample location ( xTbY, yTbY ) specifying the top-left sample of the current luma transform block relative to the top-left luma sample of the current picture is derived as follows:

( xTbY, yTbY ) = ( cIdx = = 0 ) ? ( xTb0, yTb0 ) : ( xTb0 << 1, yTb0 << 1 )  \ (H-45)

The variable splitFlag is derived as follows:
- If cIdx is equal to 0, splitFlag is set equal to split_transform_flag[ xTbY ][ yTbY ][ trafoDepth ].
- Otherwise, if all of the following conditions are true, splitFlag is set equal to 1.
  - cIdx is greater than 0
  - split_transform_flag[ xTbY ][ yTbY ][ trafoDepth ] is equal to 1
  - log2TrafoSize is greater than 2
- Otherwise, splitFlag is set equal to 0.

Depending on the value of splitFlag, the following applies:
- If splitFlag is equal to 1, the following ordered steps apply:
  1. The variables xTb1 and yTb1 are derived as follows:
     - The variable xTb1 is set equal to xTb0 + ( 1 << ( log2TrafoSize - 1 ) ).
     - The variable yTb1 is set equal to yTb0 + ( 1 << ( log2TrafoSize - 1 ) ).
  2. The general decoding process for intra blocks as specified in this subclause is invoked with the location ( xTb0, yTb0 ), the variable log2TrafoSize set equal to log2TrafoSize - 1, the variable trafoDepth set equal to trafoDepth + 1, the intra prediction mode predModeIntra, and the variable cIdx as inputs, and the output is a modified reconstructed picture before deblocking filtering.
  3. The general decoding process for intra blocks as specified in this subclause is invoked with the location ( xTb1, yTb0 ), the variable log2TrafoSize set equal to log2TrafoSize - 1, the variable trafoDepth set equal to trafoDepth + 1, the intra prediction mode predModeIntra, and the variable cIdx as inputs, and the output is a modified reconstructed picture before deblocking filtering.
4. The general decoding process for intra blocks as specified in this subclause is invoked with the location \((xTb0, yTb0)\), the variable \(2^{\log2TrafoSize} \leq 2^{\log2TrafoSize} - 1\), the variable \(trafoDepth \leq \log2TrafoSize\), the intra prediction mode \(predModeIntra\), and the variable \(cIdx\) as inputs, and the output is a modified reconstructed picture before deblocking filtering.

5. The general decoding process for intra blocks as specified in this subclause is invoked with the location \((xTb1, yTb1)\), the variable \(2^{\log2TrafoSize} \leq 2^{\log2TrafoSize} - 1\), the variable \(trafoDepth \leq \log2TrafoSize\), the intra prediction mode \(predModeIntra\), and the variable \(cIdx\) as inputs, and the output is a modified reconstructed picture before deblocking filtering.

   – Otherwise (\(splitFlag = 0\)), the following ordered steps apply:
     
     1. The variable \(nTbS\) is set equal to \(1 \ll \log2TrafoSize\).
     2. The general intra sample prediction process as specified in subclause 8.4.4.2.1 is invoked with the transform block location \((xTb0, yTb0)\), the intra prediction mode \(predModeIntra\), the transform block size \(nTbS\), and the variable \(cIdx\) as inputs, and the output is an \((nTbS) \times (nTbS)\) array \(resSamples\).

3. Depending on \(SdcFlag[ xTb0 ][ xTb0 ]\), the following applies:
   
   – If \(SdcFlag[ xTb0 ][ yTb0 ]\) is equal to 0, following applies:
     
     The scaling and transformation process as specified in subclause 8.6.2 is invoked with the luma location \((xTbY, yTbY)\), the variable \(trafoDepth\), the variable \(cIdx\), and the transform size \(trafoSize\) set equal to \(nTbS\) as inputs, and the output is an \((nTbS) \times (nTbS)\) array \(resSamples\).

   [Ed. (GT): Meeting notes say: "Implement an enabling flag at (position t.b.d.)." However there seems to be no decision on the position yet.]

   – If \(DltFlag[ nuh_layer_id ]\) is equal to 1 and \(predModeIntra\) is equal to \(INTRA_DC\), \(INTRA_ANGULAR\), \(INTRA_WFULL\), \(INTRA_DMM_WPREDTEX\), \(INTRA_DMM_CPREDTEX\), or \(INTRA_CHAIN\), the following applies, for \(i\) in the range of 0 to \(nTbS - 1\), inclusive, and \(j\) in the range of 0 to \(nTbS - 1\), inclusive:

     \[
     idx = \text{DepthValue2Idx}[\text{predSamples}[i][j]] + \text{resSamples}[i][j] \quad \text{(H.46)}
     \]

     \[
     S[i][xtb0+i][ytb0+j] = \text{Idx2DepthValue}(\text{clip3}(0, \text{NumDepthValuesInDlt}[\text{nuh_layer_id}]-1, idx)) \quad \text{(H.47)}
     \]

   – Otherwise, the following applies:

     – The picture reconstruction process prior to in-loop filtering for a colour component as specified in subclause 8.6.5 is invoked with the transform block location \((xTb0, yTb0)\), the transform block size \(nTbS\), the variable \(cIdx\), the \((nTbS) \times (nTbS)\) array \(predSamples\), and the \((nTbS) \times (nTbS)\) array \(resSamples\) as inputs.

     – Otherwise (\(SdcFlag[ xTb0 ][ yTb0 ]\) is equal to 1) the following ordered steps apply:

       – The depth value reconstruction process as specified in subclause H.8.4.4.3 is invoked with the location \((xTb0, yTb0)\), the transform size \(trafoSize\) set equal to \(nTbS\), the \((nTbS) \times (nTbS)\) array \(predSamples\), and the intra prediction mode \(predModeIntra\), as the inputs and the output is a \((nTbS) \times (nTbS)\) array \(resSamples\).

   4. For \(x\) in the range of 0 to \(nTbS - 1\) and \(y\) in the range of 0 to \(nTbS - 1\), the following applies:

     – When \(cIdx = 0\), \(resSamples_{S3}[ xTb0 + x ][ yTb0 + y ]\) is set equal to 0.

     – When \(cIdx = 1\), \(resSamples_{S3}[ xTb0 + x ][ yTb0 + y ]\) is set equal to 0.

     – When \(cIdx = 2\), \(resSamples_{S3}[ xTb0 + x ][ yTb0 + y ]\) is set equal to 0.

H.8.4.4.2 Intra sample prediction

H.8.4.4.2.1 General intra sample prediction

Inputs to this process are:

– a sample location \((xTbCmp, yTbCmp)\) specifying the top-left sample of the current transform block relative to the top left sample of the current picture,

– a variable \(predModeIntra\) specifying the intra prediction mode,

– a variable \(nTbS\) specifying the transform block size,
a variable cIdx specifying the colour component of the current block.

Output of this process is the predicted samples predSamples[ x ][ y ], with x, y = 0..nTbS – 1.

The nTbS * 4 + 1 neighbouring samples p[ x ][ y ] that are constructed samples prior to the deblocking filter process, with x = −1, y = −1..nTbS * 2 − 1 and x = 0..nTbS * 2 − 1, y = −1, are derived as follows:

- The neighbouring location ( xNbCmp, yNbCmp ) is specified by:

\[
( xNbCmp, yNbCmp ) = ( xTbCmp + x, yTbCmp + y )
\]  

(8 27)

- The current luma location ( xTbY, yTbY ) and the neighbouring luma location ( xNbY, yNbY ) are derived as follows:

\[
( xTbY, yTbY ) = ( cIdx = 0 ) \? ( xTbCmp, yTbCmp ) : ( xTbCmp << 1, yTbCmp << 1 )
\]

\[
( xNbY, yNbY ) = ( cIdx = 0 ) \? ( xNbCmp, yNbCmp ) : ( xNbCmp << 1, yNbCmp << 1 )
\]  

(8 28)

(8 29)

- The availability derivation process for a block in z-scan order as specified in subclause 6.4.1 is invoked with the current luma location ( xCurr, yCurr ) set equal to ( xTbY, yTbY ) and the neighbouring luma location ( xNbY, yNbY ) as inputs, and the output is assigned to availableN.

- Each sample p[ x ][ y ] is derived as follows:

  - If one or more of the following conditions are true, the sample p[ x ][ y ] is marked as "not available for intra prediction":

    - The variable availableN is equal to FALSE.
    - CuPredMode[ xNbY ][ yNbY ] is not equal to MODE_INTRA and constrained_intra_pred_flag is equal to 1.
    - Otherwise, the sample p[ x ][ y ] is marked as "available for intra prediction" and the sample at the location ( xNbCmp, yNbCmp ) is assigned to p[ x ][ y ].

When at least one sample p[ x ][ y ] with x = −1, y = −1..nTbS * 2 − 1 and x = 0..nTbS * 2 − 1, y = −1 is marked as "not available for intra prediction", the reference sample substitution process for intra sample prediction in subclause 8.4.4.2.2 is invoked with the samples p[ x ][ y ] with x = −1, y = −1..nTbS * 2 − 1 and x = 0..nTbS * 2 − 1, y = −1, nTbS, and cIdx as inputs, and the modified samples p[ x ][ y ] with x = −1, y = −1..nTbS * 2 − 1 and x = 0..nTbS * 2 − 1, y = −1 as output.

Depending on the value of predModeIntra, the following ordered steps apply:

1. When cIdx is equal to 0 and predModeIntra is in the range of 0 to 34, the filtering process of neighbouring samples specified in subclause 8.4.4.2.3 is invoked with the sample array p and the transform block size nTbS as inputs, and the output is reassigned to the sample array p.

2. The intra sample prediction process according to predModeIntra applies as follows:

   - If predModeIntra is equal to INTRA_PLANAR, the corresponding intra prediction mode specified in subclause 8.4.4.2.4 is invoked with the sample array p and the transform block size nTbS as inputs, and the output is the predicted sample array predSamples.

   - Otherwise, if predModeIntra is equal to INTRA_DC, the corresponding intra prediction mode specified in subclause 8.4.4.2.5 is invoked with the sample array p, the transform block size nTbS, and the colour component index cIdx as inputs, and the output is the predicted sample array predSamples.

   - Otherwise, if predModeIntra is in the range of INTRA_ANGULAR2..INTRA_ANGULAR34, the corresponding intra prediction mode specified in subclause 8.4.4.2.6 is invoked with the intra prediction mode predModeIntra, the sample array p, the transform block size nTbS, and the colour component index cIdx as inputs, and the output is the predicted sample array predSamples.

   - Otherwise, if predModeIntra is equal to INTRA_DMM_WFULL, the corresponding intra prediction mode specified in subclause H.8.4.4.2.7 is invoked with the location ( xTbY, yTbY ), the sample array p and the transform block size nTbS as the inputs and the output are the predicted sample array predSamples.

   - Otherwise, if predModeIntra is equal to INTRA_DMM_CPREDTEX, the corresponding intra prediction mode specified in subclause H.8.4.4.2.8 is invoked with the location ( xTbY, yTbY ), with the sample array p and the transform block size nTbS as the inputs and the output are the predicted sample array predSamples.
H.8.4.4.2.2 Reference sample substitution process for intra sample prediction

The specifications in subclause 8.4.4.2.2 apply.

H.8.4.4.2.3 Filtering process of neighbouring samples

The specifications in subclause 8.4.4.2.3 apply.

H.8.4.4.2.4 Specification of intra prediction mode INTRA_PLANAR

The specifications in subclause 8.4.4.2.4 apply.

H.8.4.4.2.5 Specification of intra prediction mode INTRA_DC

The specifications in subclause 8.4.4.2.5 apply.

H.8.4.4.2.6 Specification of intra prediction mode in the range of INTRA_ANGULAR2.. INTRA_ANGULAR34

The specifications in subclause 8.4.4.2.6 apply.

H.8.4.4.2.7 Specification of intra prediction mode INTRA_DMM_WFULL

Inputs to this process are:

- a sample location \((x_{\text{Tb}}, y_{\text{Tb}})\) specifying the top-left sample of the current block relative to the top-left sample of the current picture,
- the neighbouring samples \(p[x][y]\), with \(x = -1, y = -1..n_{\text{TbS}} * 2 - 1\) and \(x = 0..n_{\text{TbS}} * 2 - 1, y = -1\),
- a variable \(n_{\text{TbS}}\) specifying the transform block size,

Output of this process is:

- the predicted samples \(\text{predSamples}[x][y]\), with \(x, y = 0..n_{\text{TbS}} - 1\).

The values of the prediction samples \(\text{predSamples}[x][y]\), with \(x, y = 0..n_{\text{TbS}} - 1\), are derived as specified by the following ordered steps:

1. The variable \(\text{wedgePattern}[x][y]\) with \(x, y = 0..n_{\text{TbS}} - 1\), specifying a binary partition pattern is derived as:
   \[
   \text{wedgePattern} = \text{WedgePatternTable}\left[\log_2(n_{\text{TbS}})\right] \text{ wedge_full_tab_idx}[xTb][yTb]\]  \(\text{(H-48)}\)

2. The depth partition value derivation and assignment process as specified in subclause H.8.4.4.2.9 is invoked with the neighbouring samples \(p[x][y]\), the binary pattern \(\text{wedgePattern}[xTb][yTb]\), the transform size \(n_{\text{TbS}}\), the \(\text{dOffsetAvailFlag}\) set equal to \(\text{depth_d_flag}[xTb][yTb]\), and the \(\text{DC Offsets} \text{DcOffset}[xTb][yTb][0]\) and \(\text{DcOffset}[xTb][yTb][1]\) as inputs and the output is assigned to \(\text{predSamples}[x][y]\).

3. For \(x, y = 0..n_{\text{TbS}} - 1\), inclusive the following applies:
   - \(\text{WedgeIdx}[xTb+x][yTb+y]\) is set equal to \(\text{wedge_full_tab_idx}[xTb][yTb]\).

H.8.4.4.2.8 Specification of intra prediction mode INTRA_DMM_CPREDTEX

Inputs to this process are:

- a sample location \((x_{\text{Tb}}, y_{\text{Tb}})\) specifying the top-left sample of the current block relative to the top-left sample of the current picture,
- the neighbouring samples \(p[x][y]\), with \(x = -1, y = -1..n_{\text{TbS}} * 2 - 1\) and \(x = 0..n_{\text{TbS}} * 2 - 1, y = -1\),
- a variable \(n_{\text{TbS}}\) specifying the transform block size,

Output of this process is:

- the predicted samples \(\text{predSamples}[x][y]\), with \(x, y = 0..n_{\text{TbS}} - 1\).

The values of the prediction samples \(\text{predSamples}[x][y]\), with \(x, y = 0..n_{\text{TbS}} - 1\), are derived as specified by the following ordered steps:

1. The variable \(\text{recTextPic}\) is set equal to the array of the reconstructed luma picture samples of \(\text{TexturePic}\).

2. The variable \(\text{textThresh}\) specifying a threshold for the segmentation of \(\text{recTextPic}\) is derived as specified in the following.
   - The variable \(\text{sumTextPicVals}\) is set equal to 0.
The variables `dcVal0` and `dcVal1` are derived as specified in the following:

- For `x = 0..nTbS - 1` the following applies
  
  \[
  \text{sumTextPicVals} \leftarrow \text{recTextPic} \left[ xTb + x \right] yTb + y \]

  (H-49)

- The variable `textThresh` is set equal to ( `sumTextPicVals >> (2 * \log2 (nTbS ))` )

3. The variable `wedgeletPattern[x][y]` with `x, y=0..nTbS-1` specifying a binary partition pattern is derived as specified in the following.

- For `x = 0..nTbS - 1` the following applies
  
  \[
  \text{wedgeletPattern}[x][y] = (\text{recTextPic}[xTb + x][yTb + y] > \text{textThresh})
  \]

  (H-50)

4. The depth partition value derivation and assignment process as specified in subclause H.8.4.4.2.9 is invoked with the neighbouring samples `p[x][y]`, the binary pattern `wedgeletPattern[x][y]`, the transform size `nT`, the `dcOffsetAvailFlag` set equal to `depth_dc_flag[xTb][yTb]`, and the DC Offsets `DcOffset[xTb][yTb][0]`, and `DcOffset[xTb][yTb][1]` as inputs and the output is assigned to `predSamples[x][y]`.

H.8.4.4.2.9 Depth partition value derivation and assignment process

Inputs to this process are:

- the neighbouring samples `p[x][y]`, with `x = -1, y = -1..nTbS * 2 - 1` and `x = 0..nTbS * 2 - 1, y = -1`,
- a binary array `partitionPattern[x][y]`, with `x, y=0..nTbS-1`, specifying a partitioning of the prediction block in a partition 0 and a partition 1,
- a variable `nTbS` specifying the transform block size,
- a flag `dcOffsetAvailFlag`, specifying whether DC Offset values are available,
- the variables `dcOffsetP0` and `dcOffsetP1`, specifying the DC offsets for the block partitions

Output of this process is:

- the predicted samples `predSamples[x][y]`, with `x, y=0..nTbS-1`.

The variables `vertEdgeFlag` and `horEdgeFlag` are derived as specified in the following:

\[
\text{vertEdgeFlag} = (\text{partitionPattern}[0][0] \neq \text{partitionPattern}[nTbS - 1][0]) ? 1 : 0
\]

(H-51)

\[
\text{horEdgeFlag} = (\text{partitionPattern}[0][0] \neq \text{partitionPattern}[0][nTbS - 1]) ? 1 : 0
\]

(H-52)

The variables `dcVal0` and `dcVal1` are derived as specified in the following:

- If `vertEdgeFlag` is equal to `horEdgeFlag`, the following applies:

  \[
  \text{dcValBR} = \text{horEdgeFlag} \left( (p[-1][nTbS - 1] + p[nTbS - 1][-1]) \gg 1 \right) : (1 << (\text{BitDepthY} - 1))
  \]

  \[
  \text{dcValLT} = (p[-1][0] + p[0][-1]) \gg 1
  \]

  (H-53)

  (H-54)

- Otherwise (`horEdgeFlag` is not equal to `vertEdgeFlag`), the following applies:

  \[
  \text{dcValBR} = \text{horEdgeFlag} \left( p[-1][nTbS - 1] : p[nTbS - 1][-1] \right)
  \]

  \[
  \text{dcValLT} = \text{horEdgeFlag} \left( p(nTbS - 1) \gg 1 [-1] : p[-1][nTbS - 1] \gg 1 \right)
  \]

  (H-55)

  (H-56)

The predicted sample values `predSamples[x][y]` are derived as specified in the following:

- For `x` in the range of `0` to `(nTbS - 1)`, inclusive the following applies:
  
  - For `y` in the range of `0` to `(nTbS - 1)`, inclusive the following applies:
    
    - The variables `predDcVal` and `dcOffset` are derived as specified in the following:

      \[
      \text{predDcVal} = (\text{partitionPattern}[x][y] = = \text{partitionPattern}[0][0]) \ ? \text{dcValLT} : \text{dcValBR}
      \]

      \[
      \text{dcOffset} = \text{dcOffsetAvailFlag} \ ?(\text{partitionPattern}[x][y] = = 0) \ ? \text{dcOffsetP0} : \text{dcOffsetP1} : 0
      \]

      (H-57)

      (H-58)

- If `DltFlag[nuh_layer_id]` is equal to `0`, the following applies:

  \[
  \text{predSamples}[x][y] = \text{predDcVal} + \text{dcOffset}
  \]

  (H-59)
3D-HEVC

– Otherwise (intraChainFlag is equal to 0), the following applies:

\[
\text{predSamples}[x][y] = \text{Idx2DepthValue}[\text{DepthValue2Idx}[\text{predDcVal} + \text{dcOffset}] \\
\text{(H-60)}
\]

### H.8.4.4.2.10 Specification of tables WedgePatternTable

NOTE 1 – Tables and values resulting from the processes specified in the following are independent of any information contained in the bitstream. Therefore the derivation process described in this subclause can be carried out once as part of the initialization of the decoding process. Alternatively, the tables and values can be stored within the decoder (read-only) memory as fixed lookup tables, such that the derivation process described in this section does not need to be implemented in the decoder at all.

The list \(\text{WedgePatternTable}[\log2\text{BlkSize}]\) of binary partition patterns of size \((1 \ll \log2\text{BlkSize}) \times (1 \ll \log2\text{BlkSize})\), the variable \(\text{NumWedgePattern}[\log2\text{BlkSize}]\) specifying the number of binary partition patterns in list \(\text{WedgePatternTable}[\log2\text{BlkSize}]\) are derived as specified in the following:

– For \(\log2\text{BlkSize}\) ranging from 2 to \(\log2\text{MaxDmmCbSize}\), inclusive, the following applies:

  – Depending on \(\log2\text{BlkSize}\), the variable \(\text{resShift}\) is derived as specified in Table H-4.

<table>
<thead>
<tr>
<th>(\log2\text{BlkSize})</th>
<th>(\text{resShift})</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>4</td>
<td>0</td>
</tr>
<tr>
<td>Otherwise ((5…\log2\text{MaxDmmCbSize}))</td>
<td>(-1)</td>
</tr>
</tbody>
</table>

– The variable \(w\text{BlkSize}\) is set equal to \((1 \ll (\log2\text{BlkSize} + \text{resShift}))\).

– For wedgeOri in the range of 0 to 5, inclusive, the following ordered steps apply.

  – Depending on wedgeOri the variables \(x\text{PosS}, y\text{PosS}, x\text{PosE}, y\text{PosE}, x\text{IncS}, y\text{IncS}, x\text{IncE}, y\text{IncE}\) are derived as specified in Table H-5.

<table>
<thead>
<tr>

</tbody>
</table>

– For \(m\) in the range of 0 to \(w\text{BlkSize} - 1\), inclusive, the following applies:

  – For \(n\) in the range of 0 to \(w\text{BlkSize} - 1\), inclusive, the following applies:

    – The Wedgelet pattern generation process as specified in subclause H.8.4.4.2.10.1 is invoked with patternSize being equal to \((1 \ll \log2\text{BlkSize})\), the variable \(\text{resShift}\), variable wedgeOri, \(x\text{S}\) being equal to \((x\text{PosS} + m * x\text{IncS})\), \(y\text{S}\) being equal to \((y\text{PosS} + m * y\text{IncS})\), \(x\text{E}\) being equal to \((x\text{PosE} + n * x\text{IncE})\) and \(y\text{E}\) being equal to \((y\text{PosE} + n * y\text{IncE})\) as inputs and the output is the binary array curWedgePattern.

    – The wedgelet pattern list insertion process as specified in subclause H.8.4.4.2.10.2 is invoked with \(\log2\text{BlkSize}\), and the binary partition pattern curWedgePattern as inputs.
H.8.4.4.2.10.1 Wedgelet pattern generation process

Inputs to this process are:

– a variable patternSize specifying the binary partition pattern size,
– a resolution shift value resShift specifying the precision of the wedgelet partition start and end positions relative to patternSize,
– a variable wedgeOri specifying the orientation identifier of the wedgelet pattern,
– a variable xS specifying the partition line start horizontal position,
– a variable yS specifying the partition line start vertical position,
– a variable xE specifying the partition line end horizontal position,
– a variable yE specifying the partition line end vertical position.

Output of this process is:

– binary array wedgePattern[ x ][ y ] of size ( patternSize )x( patternSize )

The variable curSize specifying the size of the current partition pattern is derived as follows:

\[
\text{curSize} = (\text{resShift} = = \ 1) \ ? \ (\text{patternSize} \ll 1) : \text{patternSize}
\]  

(H-61)

When resShift is equal to -1 variables xS, yS, xE and yE are modified as specified in Table H-6.

Table H-6 – Specification of xS, yS, xE, yE

<table>
<thead>
<tr>
<th>wedgeOri</th>
<th>xS</th>
<th>yS</th>
<th>xE</th>
<th>yE</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>xS &lt;&lt; 1</td>
<td>yS &lt;&lt; 1</td>

<td>yE &lt;&lt; 1</td>
</tr>
<tr>
<td>1</td>
<td>curSize-1</td>
<td>yS &lt;&lt; 1</td>
<td>xE &lt;&lt; 1</td>
<td>yE &lt;&lt; 1</td>
</tr>
<tr>
<td>2</td>
<td>xS &lt;&lt; 1</td>
<td>curSize-1</td>
<td>curSize-1</td>
<td>yE &lt;&lt; 1</td>
</tr>
<tr>
<td>3</td>
<td>xS &lt;&lt; 1</td>
<td>yS &lt;&lt; 1</td>
<td>xE &lt;&lt; 1</td>
<td>curSize-1</td>
</tr>
<tr>
<td>4</td>
<td>xS &lt;&lt; 1</td>
<td>yS &lt;&lt; 1</td>
<td>xE &lt;&lt; 1</td>
<td>curSize-1</td>
</tr>
<tr>
<td>5</td>
<td>curSize-1</td>
<td>yS &lt;&lt; 1</td>
<td>xE &lt;&lt; 1</td>
<td>yE &lt;&lt; 1</td>
</tr>
</tbody>
</table>

The values of variable curPattern[ x ][ y ], are derived as specified by the following ordered steps.

1. For x, y = 0..curSize - 1, curPattern[ x ][ y ] is set equal to 0.

2. The samples of the array curPattern that form a line between ( xS, yS ) and ( xE, yE ) are set equal to 1 as specified in the following:

\[
\begin{align*}
x0 &= xS \\
y0 &= yS \\
x1 &= xE \\
y1 &= yE \\
\text{if} \ (\text{abs}(yE - yS) > \text{abs}(xE - xS)) \{
(0, y0) &= \text{Swap}(x0, y0) \\
(x1, y1) &= \text{Swap}(x1, y1)
\}
\text{if}(x0 > x1)\
(0, x1) &= \text{Swap}(x0, x1) \\
(y0, y1) &= \text{Swap}(y0, y1)
\}
\text{sumErr} = 0
\text{posY} = y0
\text{for}(\text{posX} = x0; \text{posX} <= x1; \text{posX} += +) \{
\text{if}(\text{abs}(yE - yS) > \text{abs}(xE - xS))
\text{curPattern}[\text{posY}]\ [\text{posX}] = 1
\text{else}
\text{curPattern}[\text{posX}]\ [\text{posY}] = 1
\text{sumErr} += (\text{abs}(y1 - y0) << 1)
\text{if}(\text{sumErr} >= (x1 - x0))\
\text{posY} += (y0 < y1) ? 1 : -1
\end{align*}
\]
3. The samples of curPattern belonging to the smaller partition are set equal to 1 as specified in the following:

```c
if (wedgeOri == 0 )
    for (iX = 0; iX < xS; iX++)
        for (iY = 0; curPattern[ iX ][ iY ] == 0; iY++)
            curPattern[ iX ][ iY ] = 1
else if( wedgeOri == 1 )
    for (iY = 0; iY < yS; iY++)
        for (iX = curSize - 1; curPattern[ iX ][ iY ] == 0; iX--)
            curPattern[ iX ][ iY ] = 1
else if( wedgeOri == 2 )
    for (iX = curSize - 1; iX > xS; iX--)
        for (iY = curSize - 1; curPattern[ iX ][ iY ] == 0; iY--)
            curPattern[ iX ][ iY ] = 1
else if( wedgeOri == 3 )
    for (iY = curSize - 1; iY > yS; iY--)
        for (iX = 0; curPattern[ iX ][ iY ] == 0; iX++)
            curPattern[ iX ][ iY ] = 1
else if( wedgeOri == 4 ) && ( xS + xE ) < curSize )
    for (iY = 0; iY < curSize; iY++)
        for (iX = 0; curPattern[ iX ][ iY ] == 0; iX++)
            curPattern[ iX ][ iY ] = 1
else if( wedgeOri == 5 ) && ( yS + yE ) < curSize )
    for (iY = 0; iY < curSize; iY++)
        for (iX = 0; curPattern[ iX ][ iY ] == 0; iY++)
            curPattern[ iX ][ iY ] = 1
else if( wedgeOri == 5 )
    for (iX = 0; iX < curSize; iX++)
        for (iY = curSize - 1; curPattern[ iX ][ iY ] == 0; iY--)
            curPattern[ iX ][ iY ] = 1
else if( wedgeOri == 5 )
    for (iY = curSize - 1; iY > yS; iY--)
        for (iX = 0; curPattern[ iX ][ iY ] == 0; iX++)
            curPattern[ iX ][ iY ] = 1
else if( wedgeOri == 5 )
    for (iX = 0; iX < curSize; iX++)
        for (iY = curSize - 1; curPattern[ iX ][ iY ] == 0; iY--)
            curPattern[ iX ][ iY ] = 1
```

4. The binary partition pattern wedgePattern[ x ][ y ], with x, y = 0..patternSize – 1, is derived as specified in the following.

- If resShift is equal to 1, the following applies.
  - Depending on wedgeOri, the variables xOff and yOff are set as specified in Table H-7.

<table>
<thead>
<tr>
<th>wedgeOri</th>
<th>(xS + xE) &lt; curSize</th>
<th>xOff</th>
<th>yOff</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>

<tr>
<td>4</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>5</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

- For x, y = 0..patternSize – 1 the following applies:

  ```c
  wedgePattern[ x ][ y ] = curPattern[ ( x << 1 ) + xOff ][ ( y << 1 ) + yOff ]
  ```

- Otherwise (resShift is not equal to 1), wedgePattern is set equal to curPattern.
H.8.4.4.2.10.2 Wedgelet pattern list insertion process

Inputs to this process are:

– a variable log2BlkSize specifying the binary partition pattern size as ( 1 << log2BlkSize ),
– binary partition pattern wedgePattern[ x ][ y ], with x, y =0..( 1 << log2BlkSize ) − 1.

The variable isValidFlag specifying whether the binary partition pattern wedgePattern is added to the list WedgePatternTable[ log2BlkSize ] not is set equal to 0.

The value of isValidFlag is derived as specified by the following ordered steps.

1. For x, y = 0..( 1 << log2BlkSize ) − 1 the following applies.
   – When wedgePattern[ x ][ y ] is not equal to wedgePattern[ 0 ][ 0 ] the flag isValidFlag is set to 1.
2. For k = 0..NumWedgePattern[ log2BlkSize ] − 1 the following applies.
   – The flag patIdenticalFlag is set equal to 1.
   – For x, y =0..( 1 << log2BlkSize ) − 1 the following applies.
     – When wedgePattern[ x ][ y ] is not equal to WedgePatternTable[ log2BlkSize ][ k ][ x ][ y ],
       patIdenticalFlag is set to 0.
     – When patIdenticalFlag is equal to 1, isValidFlag is set to 0.
3. For k = 0..NumWedgePattern[ log2BlkSize ] − 1 the following applies.
   – The flag patInvIdenticalFlag is set to 1.
   – For x, y =0..( 1 << log2BlkSize ) − 1 the following applies.
     – When wedgePattern[ x ][ y ] is equal to WedgePatternTable[ log2BlkSize ][ k ][ x ][ y ],
       patInvIdenticalFlag is set to 0.
     – When patInvIdenticalFlag is equal to 1, isValidFlag is set to 0.

When isValidFlag is equal to 1, the following applies.

– The pattern WedgePatternTable[ log2BlkSize ][ NumWedgePattern[ log2BlkSize ] ] is set equal to wedgePattern.
– The value of NumWedgePattern[ log2BlkSize ] is increased by one.

H.8.4.4.3 Depth value reconstruction process

Inputs to this process are:

– a luma location ( xTb, yTb ) specifying the top-left luma sample of the current block relative to the top-left luma sample of the current picture,
– a variable nTbS specifying the transform block size,
– predicted samples predSamples[ x ][ y ], with x, y =0..nTbS − 1
– the intra prediction mode predModeIntra,

Output of this process is:

– reconstructed depth value samples resSamples[ x ][ y ], with x, y = 0.. nTbS − 1.

Depending on predModeIntra the array wedgePattern[ x ][ y ] with x, y =0.. nTbS − 1 specifying the binary segmentation pattern is derived as follows.

– If predModeIntra is equal to INTRA_DMM_WFULL, the following applies.
  wedgePattern = WedgePatternTable[ Log2( nTbS ) ][ wedge_full_tab_idx[ xTb ][ yTb ] ]
– Otherwise ( predModeIntra is not equal to INTRA_DMM_WFULL ), the following applies.
  – For x, y = 0..nTbS − 1 wedgePattern[ x ][ y ] is set equal to 0.

Depending on DltFlag[ nuh_layer_id ] the reconstructed depth value samples resSamples[ x ][ y ] are derived as specified in the following:
If DltFlag[ nuh_layer_id ] is equal to 0, the following applies:

For x, y = 0...nTbS − 1, the reconstructed depth value samples resSamples[ x ][ y ] are derived as specified in the following:

\[
\text{resSamples}[ x ][ y ] = \text{predSamples}[ x ][ y ] + \text{DcOffset}[ xTb ][ yTb ][ \text{wedgePattern}[ x ][ y ] ] \quad \text{(H-63)}
\]

Otherwise ( DltFlag[ nuh_layer_id ] is equal to 1 ), the following applies:

The variables dcPred[ 0 ] and dcPred[ 1 ] are derived as specified in the following:

If predModeIntra is equal to INTRA_DC, the following applies:

\[
\text{dcPred}[ 0 ] = \text{predSamples}[ nTbS − 1 ][ nTbS − 1 ] \quad \text{(H-64)}
\]

Otherwise, if predModeIntra is equal to INTRA_PLANAR, the following applies:

\[
\text{dcPred}[ 0 ] = ( \text{predSamples}[ 0 ][ 0 ] + \text{predSamples}[ nTbS − 1 ][ 0 ] + \text{predSamples}[ nTbS − 1 ][ 0 ][
+ \text{predSamples}[ nTbS − 1 ][ nTbS − 1 ] + 2 ) \gg 2 } \quad \text{(H-65)}
\]

Otherwise, ( predModeIntra is equal to INTRA_DMM_WFULL ), the following applies.

\[
\text{dcPred}[ 0 ][ 0 ] = \text{predSamples}[ nTbS − 1 ][ nTbS − 1 ] \quad \text{(H-66)}
\]

\[
\text{dcPred}[ \text{wedgePattern}[ nTbS − 1 ][ 0 ][ 0 ] = \text{predSamples}[ nTbS − 1 ][ 0 ] \quad \text{(H-67)}
\]

\[
\text{dcPred}[ \text{wedgePattern[ 0 ][ nTbS − 1 ] = predSamples[ 0 ][ nTbS − 1 ] } \quad \text{(H-68)}
\]

\[
\text{dcPred}[ \text{wedgePattern[ nTbS − 1 ][ nTbS − 1 ] = predSamples[ nTbS − 1 ][ nTbS − 1 ] } \quad \text{(H-69)}
\]

For x, y = 0...nTbS − 1, the reconstructed depth value samples resSamples[ x ][ y ] are derived as specified in the following:

\[
\text{dltIdxPred} = \text{DepthValue2Idx[ dcPred[ \text{wedgePattern[ x ][ y ] ] ] ]} \quad \text{(H-70)}
\]

\[
\text{dltIdxResi} = \text{DcOffset}[ xTb ][ yTb ][ \text{wedgePattern}[ x ][ y ] ] \quad \text{(H-71)}
\]

\[
\text{resSamples}[ x ][ y ] = \text{predSamples}[ x ][ y ] + \text{Idx2DepthValue[ dltIdxPred + dltIdxResi ]} - \text{dcPred[ wedgePattern[ x ][ y ] ] } \quad \text{(H-72)}
\]

### H.8.5 Decoding process for coding units coded in inter prediction mode

#### H.8.5.1 General decoding process for coding units coded in inter prediction mode

Inputs to this process are:

- a luma location ( xCb, yCb ) specifying the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a variable log2CbSize specifying the size of the current coding block.

Output of this process is a modified reconstructed picture before deblocking filtering.

The derivation process for quantization parameters as specified in subclause 8.6.1 is invoked with the luma location ( xCb, yCb ) as input.

The variable nCbS_L is set equal to 1 ⌈ log2CbSize and the variable nCbS_C is set equal to 1 ⌈ ( log2CbSize − 1 ).

The decoding process for coding units coded in inter prediction mode consists of following ordered steps:

1. When iv_mv_pred_flag[ nuh_layer_id ] is equal to 1, or iv_res_pred_flag[ nuh_layer_id ] is equal to 1 or view_synthesis_pred_flag[ nuh_layer_id ] is equal to 1, following applies:
   - If DepthFlag is equal to 0 the derivation process for disparity vectors as specified in subclause H.8.5.5 is invoked with the luma locations ( xCb, yCb ), the coding block size nCbS_L as the inputs.
   - Otherwise (DepthFlag is equal to 1), the derivation process for disparity vectors from neighbouring depth samples as specified in subclause H.8.5.6 is invoked with the luma locations ( xCb, yCb ), the coding block size nCbS_C as the inputs.

2. The inter prediction process as specified in subclause H.8.5.3 is invoked with the luma location ( xCb, yCb ) and the luma coding block size log2CbSize as inputs, and the outputs are three arrays predSamplesL_L, predSamplesL_Ch, and predSamplesC_Ch.

3. The decoding process for the residual signal of coding units coded in inter prediction mode specified in subclause H.8.5.3.3.9 is invoked with the luma location ( xCb, yCb ) and the luma coding block size log2CbSize.
The reconstructed samples of the current coding unit are derived as follows:

1. The picture reconstruction process prior to in-loop filtering for a colour component as specified in subclause 8.6.5 is invoked with the luma coding block location \((x_{C}, y_{C})\), the variable \(n_{CS}\) set equal to \(n_{CBS}\), the variable \(c_{Idx}\) set equal to 0, the \((n_{CBS})x(n_{CBS})\) array \(\text{predSamples}_{L}\) set equal to \(\text{predSamples}_{L}\), and the \((n_{CBS})x(n_{CBS})\) array \(\text{resSamples}_{L}\) set equal to \(\text{resSamples}_{L}\) as inputs.

2. The picture reconstruction process prior to in-loop filtering for a colour component as specified in subclause 8.6.5 is invoked with the chroma coding block location \((x_{C}/2, y_{C}/2)\), the variable \(n_{CS}\) set equal to \(n_{CBS}\), the variable \(c_{Idx}\) set equal to 1, the \((n_{CBS})x(n_{CBS})\) array \(\text{predSamples}_{Cb}\) set equal to \(\text{predSamples}_{Cb}\), and the \((n_{CBS})x(n_{CBS})\) array \(\text{resSamples}_{Cb}\) set equal to \(\text{resSamples}_{Cb}\) as inputs.

3. The picture reconstruction process prior to in-loop filtering for a colour component as specified in subclause 8.6.5 is invoked with the chroma coding block location \((x_{C}/2, y_{C}/2)\), the variable \(n_{CS}\) set equal to \(n_{CBS}\), the variable \(c_{Idx}\) set equal to 2, the \((n_{CBS})x(n_{CBS})\) array \(\text{predSamples}_{Cr}\) set equal to \(\text{predSamples}_{Cr}\), and the \((n_{CBS})x(n_{CBS})\) array \(\text{resSamples}_{Cr}\) set equal to \(\text{resSamples}_{Cr}\) as inputs.

**H.8.5.2 Inter prediction process**

The specifications in subclause 8.5.2 apply with the following modification:

- All invocations of the process specified in subclause 8.5.3 are replaced with invocations of the process specified in subclause H.8.5.3.

**H.8.5.3 Decoding process for prediction units in inter prediction mode**

**H.8.5.3.1 General**

Inputs to this process are:

- A luma location \((x_{B}, y_{B})\) specifying the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,

- A luma location \((x_{B1}, y_{B1})\) specifying the top-left sample of the current luma prediction block relative to the top-left sample of the current luma coding block,

- A variable \(n_{CBS}\) specifying the size of the current luma coding block,

- A variable \(n_{PBW}\) specifying the width of the current luma prediction block,

- A variable \(n_{PBH}\) specifying the width of the current luma prediction block,

- A variable \(partIdx\) specifying the index of the current prediction unit within the current coding unit.

Outputs of this process are:

- An \((n_{CBSL})x(n_{CBSL})\) array \(\text{predSamples}_{L}\) of luma prediction samples, where \(n_{CBSL}\) is derived as specified below,

- An \((n_{CSC})x(n_{CSC})\) array \(\text{predSamples}_{Cb}\) of chroma prediction samples for the component \(Cb\), where \(n_{CSC}\) is derived as specified below,

- An \((n_{CSC})x(n_{CSC})\) array \(\text{predSamples}_{Cr}\) of chroma prediction samples for the component \(Cr\), where \(n_{CSC}\) is derived as specified below.

The variable \(n_{CBSL}\) is set equal to \(n_{CBS}\) and the variable \(n_{CSC}\) is set equal to \(n_{CBS} \gg 1\).

The decoding process for prediction units in inter prediction mode consists of the following ordered steps:

1. The derivation process for motion vector components and reference indices as specified in subclause H.8.5.3.2 is invoked with the luma coding block location \((x_{C}, y_{C})\), the luma prediction block location \((x_{B}, y_{B})\), the luma coding block size \(n_{CBS}\), the luma prediction block width \(n_{PBW}\), the luma prediction block height \(n_{PBH}\), and the prediction unit index \(partIdx\) as inputs. If \(subPbMotionFlag\) is equal to 0, the decoding process for inter sample prediction as specified in subclause H.8.5.3.3.1 is invoked with the luma coding block location \((x_{C}, y_{C})\), the luma prediction block location \((x_{B}, y_{B})\), the luma coding block size \(n_{CBS}\), the luma prediction block width \(n_{PBW}\), the luma prediction block height \(n_{PBH}\), the luma motion vectors \(mvL0\) and \(mvL1\), the chroma motion vectors \(mvCL0\) and \(mvCL1\), the reference indices \(refIdxL0\) and \(refIdxL1\), and the prediction list utilization flags \(predFlagL0\) and \(predFlagL1\) as outputs.

2. Depending on \(subPbMotionFlag\), the following applies:

   - If \(subPbMotionFlag\) is equal to 0; the decoding process for inter sample prediction as specified in subclause H.8.5.3.3.1 is invoked with the luma coding block location \((x_{C}, y_{C})\), the luma prediction block location \((x_{B}, y_{B})\), the luma coding block size \(n_{CBS}\), the luma prediction block width \(n_{PBW}\), the luma prediction block height \(n_{PBH}\), the luma motion vectors \(mvL0\) and \(mvL1\), the chroma motion vectors \(mvCL0\) and \(mvCL1\), the reference indices \(refIdxL0\) and \(refIdxL1\), and the prediction list utilization flags \(predFlagL0\) and \(predFlagL1\) as outputs.
vectors \( \text{mvCL0} \) and \( \text{mvCL1} \), the reference indices \( \text{refIdxL0} \) and \( \text{refIdxL1} \), and the prediction list utilization flags \( \text{predFlagL0} \) and \( \text{predFlagL1} \) as inputs, and the inter prediction samples \( (\text{predSamples}) \) that are an \((nCbSL) \times (nCbSL)\) array \( \text{predSamplesL} \) of prediction luma samples and two \((nCbSC) \times (nCbSC)\) arrays \( \text{predSamplesCr} \) and \( \text{predSamplesCr} \) of prediction chroma samples, one for each of the chroma components \( \text{Cb} \) and \( \text{Cr} \), as outputs.

Otherwise (\( \text{subPbMotionFlag} \) is equal to 1), the decoding process for sub prediction block wise inter sample prediction as specified in subclause H.8.5.3.3.9 is invoked with the luma coding block location \((xCb, yCb)\), the luma prediction block location \((xBl, yBl)\), the luma coding block size block \(nCbS\), the luma prediction block width \(nPbW\), the luma prediction block height \(nPbH\) as inputs, and the inter prediction samples \( (\text{predSamples}) \) that are an \((nCbSL) \times (nCbSL)\) array \( \text{predSamplesL} \) of prediction luma samples and two \((nCbSC) \times (nCbSC)\) arrays \( \text{predSamplesCr} \) and \( \text{predSamplesCr} \) of prediction chroma samples, one for each of the chroma components \( \text{Cb} \) and \( \text{Cr} \), as outputs.

For use in derivation processes of variables invoked later in the decoding process, the following assignments are made for \( x = xBl..xBl + nPbW - 1 \) and \( y = yBl..yBl + nPbH - 1 \):

\[
\begin{align*}
\text{MvL0}[xCb + x][yCb + y] &= \text{subPbMotionFlag} \ ? \ \text{SubPbMvL0}[xCb + x][yCb + y] : \text{mvL0} \quad \text{(H-73)} \\
\text{MvL1}[xCb + x][yCb + y] &= \text{subPbMotionFlag} \ ? \ \text{SubPbMvL1}[xCb + x][yCb + y] : \text{mvL1} \quad \text{(H-74)} \\
\text{RefIdxL0}[xCb + x][yCb + y] &= \text{subPbMotionFlag} \ ? \ \text{SubPbRefIdxL0}[xCb + x][yCb + y] : \text{refIdxL0} \quad \text{(H-75)} \\
\text{RefIdxL1}[xCb + x][yCb + y] &= \text{subPbMotionFlag} \ ? \ \text{SubPbRefIdxL1}[xCb + x][yCb + y] : \text{refIdxL1} \quad \text{(H-76)} \\
\text{PredFlagL0}[xCb + x][yCb + y] &= \text{subPbMotionFlag} \ ? \ \text{SubPbPredFlagL0}[xCb + x][yCb + y] : \text{predFlagL0} \quad \text{(H-77)} \\
\text{PredFlagL1}[xCb + x][yCb + y] &= \text{subPbMotionFlag} \ ? \ \text{SubPbPredFlagL1}[xCb + x][yCb + y] : \text{predFlagL1} \quad \text{(H-78)}
\end{align*}
\]

**H.8.5.3.2 Derivation process for motion vector components and reference indices**

Inputs to this process are:

- a luma location \((xCb, yCb)\) of the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a luma location \((xBl, yBl)\) of the top-left sample of the current luma prediction block relative to the top-left sample of the current luma coding block,
- a variable \(nCbS\) specifying the size of the current luma coding block,
- two variables \(nPbW\) and \(nPbH\) specifying the width and the height of the luma prediction block,
- a variable \(partIdx\) specifying the index of the current prediction unit within the current coding unit.

Outputs of this process are:

- the luma motion vectors \(\text{mvL0}\) and \(\text{mvL1}\),
- the chroma motion vectors \(\text{mvCL0}\) and \(\text{mvCL1}\),
- the reference indices \(\text{refIdxL0}\) and \(\text{refIdxL1}\),
- the prediction list utilization flags \(\text{predFlagL0}\) and \(\text{predFlagL1}\),
- the flag \(\text{subPbMotionFlag}\), specifying, whether the motion data of the current PU has sub prediction block size motion accuracy.

Let \((xPb, yPb)\) specify the top-left sample location of the current luma prediction block relative to the top-left luma sample of the current picture where \(xPb = xCb + xBl\) and \(yPb = yCb + yBl\).

Let the variable \(\text{currPic}\) and \(\text{ListX}\) be the current picture and \(\text{RefPicListX}\), with \(X\) being 0 or 1, of the current picture, respectively.

The function \(\text{LongTermRefPic}(aPic, aPb, \text{refIdx}, \text{LX})\), with \(X\) being 0 or 1, is defined as follows:

- If the picture with index \(\text{refIdx}\) from reference picture list \(\text{LX}\) of the slice containing prediction block \(aPb\) in the picture \(aPic\) was marked as "used for long term reference" at the time when \(aPic\) was the current picture, \(\text{LongTermRefPic}(aPic, aPb, \text{refIdx}, \text{LX})\) is equal to 1.
- Otherwise, \(\text{LongTermRefPic}(aPic, aPb, \text{refIdx}, \text{LX})\) is equal to 0.

The variables \(\text{vspModeFlag}, \text{ivpMvFlagL0}, \text{ivpMvFlagL1}\) and \(\text{subPbMotionFlag}\) are set equal to 0.
For the derivation of the variables mvL0 and mvL1, refIdxL0 and refIdxL1, as well as predFlagL0 and predFlagL1, the following applies:

- If merge_flag[xPb][yPb] is equal to 1, the derivation process for luma motion vectors for merge mode as specified in subclause H.8.5.3.2.1 is invoked with the luma location (xCb, yCb), the luma location (xPb, yPb), the variables nCbS, nPbW, nPbH, and the partition index partIdx as inputs, and the output being the luma motion vectors mvL0, mvL1, the reference indices refIdxL0, refIdxL1, and the prediction list utilization flags predFlagL0 and predFlagL1. The disparity vector availability flags ivpMvFlagL0 and ivpMvFlagL1, the flag vspModeFlag, and the flag subPbMotionFlag.

- Otherwise, for X being replaced by either 0 or 1 in the variables predFlagLX, mvLX, and refIdxLX, in PRED_LX, and in the syntax elements ref_idx_lX and MvdLX, the following applies:

1. The variables refIdxLX and predFlagLX are derived as follows:
   - If inter_pred_idc[xPb][yPb] is equal to PRED_LX or PRED_BI,
     refIdxLX = ref_idx_lX[xPb][yPb]  \[(H-79)\]
     predFlagLX = 1 \[(H-80)\]
   - Otherwise, the variables refIdxLX and predFlagLX are specified by:
     refIdxLX = -1 \[(H-81)\]
     predFlagLX = 0 \[(H-82)\]

2. The variable mvdLX is derived as follows:
   - mvdLX[0] = MvdLX[xPb][yPb][0] \[(H-83)\]
   - mvdLX[1] = MvdLX[xPb][yPb][1] \[(H-84)\]

3. When predFlagLX is equal to 1, the derivation process for luma motion vector prediction in subclause 8.5.3.2.5 is invoked with the luma coding block location (xCb, yCb), the coding block size nCbS, the luma prediction block location (xPb, yPb), the variables nPbW, nPbH, refIdxLX, and the partition index partIdx as inputs, and the output being mvplX.

4. When predFlagLX is equal to 1, the luma motion vector mvLX is derived as follows:
   - uLX[0] = (mpvLX[0] + mvdLX[0] + 2^{16}) \%(2^{16}) \[(H-85)\]
   - mvLX[0] = (uLX[0] >= 2^{15}) ? (uLX[0] - 2^{16}) : uLX[0] \[(H-86)\]

   **NOTE** – The resulting values of mvLX[0] and mvLX[1] as specified above will always be in the range of $-2^{15}$ to $2^{16} - 1$, inclusive.

When ChromaArrayType is not equal to 0 and predFlagLX, with X being 0 or 1, is equal to 1, the derivation process for chroma motion vectors in subclause 8.5.3.2.9 is invoked with mvLX as input, and the output being mvCLX.

For use in derivation processes of variables invoked later in the decoding process, the following assignments are made for x = xPb, (xPb + nPbW - 1), y = yPb, (yPb + nPbH - 1) (with X being either 0 or 1):

- IvpMvFlagLX[x][y] = IvpMvFlagLX \[(H-89)\]
- VspModeFlag[x][y] = VspModeFlag \[(H-90)\]

**H.8.5.3.2.1 Derivation process for luma motion vectors for merge mode**

This process is only invoked when merge_flag[xPb][yPb] is equal to 1, where (xPb, yPb) specify the top-left sample of the current luma prediction block relative to the top-left luma sample of the current picture.

Inputs to this process are:

- a luma location (xCb, yCb) of the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a luma location (xPb, yPb) of the top-left sample of the current luma prediction block relative to the top-left luma sample of the current picture,
- a variable nCbS specifying the size of the current luma coding block,
two variables nPbW and nPbH specifying the width and the height of the luma prediction block,
a variable partIdx specifying the index of the current prediction unit within the current coding unit.

Outputs of this process are:

- the luma motion vectors mvL0 and mvL1,
- the reference indices refIdxL0 and refIdxL1,
- the prediction list utilization flags predFlagL0 and predFlagL1,
- the disparity vector utilization flags ivpMvFlagL0 and ivpMvFlagL1,
- the flag vspModeFlag, specifying, whether the current PU is coded using view synthesis prediction,
- the flag subPbMotionFlag, specifying, whether the motion data of the current PU has sub prediction block size motion accuracy.

[Ed. (GT): In particular two things need to be check in this process: 1.) Are the limits on candidates in the list correct (e.g. MaxNumMergeCand vs. 5 + NumExtraMergeCand) 2.) Is (xOrigP, yOrigP) and (xPb, yPb) used correctly in all places?]

The function differentMotion( N, M ) is specified as follows:

- If one of the following conditions is true, differentMotion( N, M ) is equal to 1:
  - predFlagLXN != predFlagLXM (with X being replaced by 0 and 1),
  - mvLXN != mvLXM (with X being replaced by 0 and 1),
  - refIdxLXN != refIdxLXM (with X being replaced by 0 and 1),
- Otherwise, differentMotion( N, M ) is equal to 0.

The motion vectors mvL0 and mvL1, the reference indices refIdxL0 and refIdxL1, and the prediction utilization flags predFlagL0 and predFlagL1 are derived by the following ordered steps:

1. The derivation process for the base merge candidate list as specified in subclause H.8.5.3.2.18 is invoked with the luma location (xCb, yCb), the luma location (xPb, yPb), the variables nCbS, nPbW, nPbH, and the partition index partIdx as inputs, and the output being a modified luma location (xPb, yPb), the modified variables nPbW and nPbH, the modified variable partIdx, the luma location (xOrigP, yOrigP), the variables nOrigPbW and nOrigPbH, the merge candidate list baseMergeCandList, the luma motion vectors mvL0N and mvL1N, the reference indices refIdxL0N and refIdxL1N, and the prediction list utilization flags predFlagL0N and predFlagL1N, with N being replaced by all elements of baseMergeCandList.

2. For N being replaced by A1, B1, B0, A0 and B2, the following applies:
   - If N is an element in baseMergeCandList, availableFlagN is set equal to 1.
   - Otherwise (N is not an element in baseMergeCandList), availableFlagN is set equal to 0.

3. Depending on iv_mv_pred_flag[ nuh_layer_id ], the following applies:
   - If iv_mv_pred_flag[ nuh_layer_id ] is equal to 0, the flags availableFlagIVMC, availableIVMCshift and availableFlagIVDC are set equal to 0.
   - Otherwise (iv_mv_pred_flag[ nuh_layer_id ] is equal to 1), the derivation process for the inter-view merge candidates as specified in subclause H.8.5.3.2.10 is invoked with the luma location (xPb, yPb), the variables nPbW and nPbH, as the inputs and the output is assigned to the availability flags availableFlagIVMC, availableIVMCShift and availableFlagIVDC, the reference indices refIdxLIvMC, refIdxLIvMCshift and refIdxLIvDC, the prediction list utilization flags predFlagLIvMC, predFlagLIvMCshift and predFlagLIvDC, and the motion vectors mvLIvMC, mvLIvMCshift and mvLIvDC (with X being 0 or 1, respectively).

4. Depending on view_synthesis_pred_flag[ nuh_layer_id ], the following applies:
   - If view_synthesis_pred_flag[ nuh_layer_id ] is equal to 0, the flag availableFlagVSP is set equal to 0.
   - Otherwise (view_synthesis_pred_flag[ nuh_layer_id ] is equal to 1), the derivation process for a view synthesis prediction merge candidate as specified in subclause H.8.5.3.2.13 is invoked with the luma locations (xCb, yCb) as input and the outputs are the availability flag availableFlagVSP, the reference indices refIdxL0VSP and refIdxL1VSP, the prediction list utilization flags predFlagL0VSP and predFlagL1VSP, and the motion vectors mvL0VSP and mvL1VSP.
5. Depending on mpi_flag[ nuh_layer_id ], the following applies:
   - If mpi_flag[ nuh_layer_id ] is equal to 0, the variable availableFlagT is set equal to 0.
   - Otherwise (mpi_flag[ nuh_layer_id ] is equal to 1), the derivation process for the texture merging candidate as specified in subclause H.8.5.3.2.14 is invoked with the luma location (xPb, yPb), the variables nPbW and nPbH as the inputs and the outputs are the flag availableFlagT, the prediction utilization flags predFlagL0T and predFlagL1T, the reference indices refIdxL0T and refIdxL1T, and the motion vectors mvL0T and mvL1T.

6. The merging candidate list, extMergeCandList, is constructed as follows:
   
   ```c
   if (availableFlagT)
     extMergeCandList[ i++ ] = T
   if (availableFlagIvMC && ( !availableFlagT || differentMotion( T, IvMC ) ))
     extMergeCandList[ i++ ] = IvMC
   N = DepthFlag ? T : IvMC
   if (availableFlagA0 && ( !availableFlagN || differentMotion( N, A0 ) ))
     extMergeCandList[ i++ ] = A0
   if (availableFlagB0 && ( !availableFlagN || differentMotion( N, B0 ) ))
     extMergeCandList[ i++ ] = B0
   if (availableFlagB1 && ( !availableFlagN || differentMotion( N, B1 ) ) &
     nPiFlag[ nuh_layer_id ])
     extMergeCandList[ i++ ] = B1
   if (availableFlagB2 && ( !availableFlagN || differentMotion( N, B2 ) ) &
     nPiFlag[ nuh_layer_id ])
     extMergeCandList[ i++ ] = B2
   if (availableFlagIvMCShift && i < ( 5 + NumExtraMergeCand ) &
     ( !availableFlagIvMC || differentMotion( IvMC, IvMCShift ) ) )
     extMergeCandList[ i++ ] = IvMCShift
   (H-91)
   ```

7. The variable availableFlagIvMCShift is set equal to 0, and when availableFlagIvMCShift is equal to 0, and i is less than ( 5 + NumExtraMergeCand ), the derivation process for the shifted disparity merging candidate as specified in subclause H.8.5.3.2.15 is invoked with the luma location (xPb, yPb), the variables nPbW and nPbH, and the availability flags availableFlagN, the reference indices refIdxL0N and refIdxL1N, the prediction list utilization flags predFlagL0N and predFlagL1N, the motion vectors mvL0N and mvL1N, of every candidate N being in extMergeCandList, extMergeCandList, and i as the inputs and the outputs are the flag availableFlagIvMCShift, the prediction utilization flags predFlagL0IvMCShift and predFlagL1IvMCShift, the reference indices refIdxL0IvMCShift and refIdxL1IvMCShift, and the motion vectors mvL0IvMCShift and mvL1IvMCShift.

8. The merging candidate list, extMergeCandList, is constructed as follows:
   
   ```c
   if (availableFlagIvMCShift)
     extMergeCandList[ i++ ] = IvMCShift
   j = 0
   while( i < MaxNumMergeCand ) {
     N = baseMergeCandList[ j++ ]
     if( N != A0 && N != B1 && N != B0 && N != A0 && N != B2 )
       extMergeCandList[ i++ ] = N
   }
   (H-92)
   ```

9. The variable N is set equal to extMergeCandList[ merge_idx[ xOrigP ][ yOrigP ] ].
10. The variable subPbMotionFlag is set equal to ( N = = IvMC ).
11. The following assignments are made with X being replaced by 0 or 1:
   
   ```c
   mvLX = subPbMotionFlag ? 0 : mvLXN
   refIdxLX = subPbMotionFlag ? -1 : refIdxLXN
   predFlagLX = subPbMotionFlag ? 0 : predFlagLXN
   (H-93) (H-94) (H-95)
   ```
12. When predFlagL0 is equal to 1 and predFlagL1 is equal to 1, and \((n_{\text{OrigPbW}} + n_{\text{OrigPbH}})\) is equal to 12, the following applies:

\[
\text{refIdxL1} = -1
\]  
\[
\text{predFlagL1} = 0
\]  

(H-96)  
(H-97)

13. The derivation process for a view synthesis prediction flag as specified in subclause H.8.5.3.2.17 is invoked with the luma location \((x_{\text{Pb}}, y_{\text{Pb}})\), the variables \(n_{\text{PbW}}\) and \(n_{\text{PbH}}\), the merge candidate indicator \(N\) as the inputs, and the output is the \(\text{mergeCandIsVspFlag}\).

14. The variable \(\text{vspModeFlag}\) is derived as specified in the following:

\[
\text{vspModeFlag} = \text{mergeCandIsVspFlag} & \& \ !\text{icFlag} & \& (\text{iv_res_pred_weight_idx} = = 0 )
\]  

(H-98)

15. The disparity availability flag \(\text{ivpMvFlagLX}\) is derived as follows (with \(X\) being replace by 0 or 1):

- If \(\text{DepthFlag}\) is equal to 0 and one of the following conditions is true, \(\text{ivpMvFlagLX}\) is set equal to 1

[Ed. (GT): There is some redundancy in draft and software since disparities equal for both lists.(#7) ]

- \(\text{predFlagLXIvMC} & \& \ \text{extMergeCandList}[\text{merge_idx}[x_{\text{Pb}}][y_{\text{Pb}}]] = = \text{IvMC}\)
- \(\text{predFlagLXIvMCShift} & \& \ \text{extMergeCandList}[\text{merge_idx}[x_{\text{Pb}}][y_{\text{Pb}}]] = = \text{IvMCShift}\)

[Ed. (GT): PredMode[\(x_{\text{Cb}} \text{ } y_{\text{Cb}}\] = = \text{MODE_SKIP} might be added here instead of testing it in the disparity vector derivation process]

- Otherwise, \(\text{ivpMvFlagLX}\) is set equal to 0.

**H.8.5.3.2.2 Derivation process for spatial merging candidates**

The specifications in subclause 8.5.3.2.2 apply.

**H.8.5.3.2.3 Derivation process for combined bi-predictive merging candidates**

The specifications in subclause 8.5.3.2.3 apply.

**H.8.5.3.2.4 Derivation process for zero motion vector merging candidates**

The specifications in subclause 8.5.3.2.4 apply.

**H.8.5.3.2.5 Derivation process for luma motion vector prediction**

The specifications in subclause 8.5.3.2.5 apply.

**H.8.5.3.2.6 Derivation process for motion vector predictor candidates**

The specifications in subclause 8.5.3.1.6 apply.

**H.8.5.3.2.7 Derivation process for temporal luma motion vector prediction**

The specifications in subclause 8.5.3.2.7 apply, with the following modifications:

- All invocations of the process specified in subclause 8.5.3.2.8 are replaced with invocations of the process specified in subclause H.8.5.3.2.8.

**H.8.5.3.2.8 Derivation process for collocated motion vectors**

Inputs to this process are:

- a variable \(\text{currPb}\) specifying the current prediction block,
- a variable \(\text{colPic}\) specifying the collocated picture,
- a variable \(\text{colPb}\) specifying the collocated prediction block inside the collocated picture specified by \(\text{colPic}\),
- a luma location \((x_{\text{colPb}}, y_{\text{colPb}})\) specifying the top-left sample of the collocated luma prediction block specified by \(\text{colPb}\) relative to the top-left luma sample of the collocated picture specified by \(\text{colPic}\),
- a reference index \(\text{refIdxLX}\), with \(X\) being 0 or 1.

Outputs of this process are:

- the motion vector prediction \(\text{mvLXC}\).
The availability flag availableFlagLXCol.

The variable currPic specifies the current picture.

The arrays predFlagLXCol[ x ][ y ], mvLXCol[ x ][ y ], and refIdxLXCol[ x ][ y ] are set equal to the corresponding arrays of the collocated picture specified by colPic, PredFlagLXCol[ x ][ y ], MvLXCol[ x ][ y ], and RefIdxLXCol[ x ][ y ], respectively, with X being the value of X this process is invoked for.

The variables mvLXCol and availableFlagLXCol are derived as follows:

- If colPb is coded in an intra prediction mode, both components of mvLXCol and availableFlagLXCol are set equal to 0.
- Otherwise, the motion vector mvCol, the reference index refIdxCol, and the reference list identifier listCol are derived as follows:
  - If predFlagL0Col[ xColPb ][ yColPb ] is equal to 0, mvCol, refIdxCol, and listCol are set equal to mvL0Col[ xColPb ][ yColPb ], refIdxL0Col[ xColPb ][ yColPb ], and L0, respectively.
  - Otherwise, if predFlagL1Col[ xColPb ][ yColPb ] is equal to 1 and predFlagL1Col[ xColPb ][ yColPb ] is equal to 0, mvCol, refIdxCol, and listCol are set equal to mvL0Col[ xColPb ][ yColPb ], refIdxL0Col[ xColPb ][ yColPb ], and L0, respectively.
  - Otherwise (predFlagL0Col[ xColPb ][ yColPb ] is equal to 1 and predFlagL1Col[ xColPb ][ yColPb ] is equal to 1), the following assignments are made:
    - If DiffPicOrderCnt( aPic, currPic ) is less than or equal to 0 for every picture aPic in every reference picture list of the current slice, mvCol, refIdxCol, and listCol are set equal to mvLXCol[ xColPb ][ yColPb ], refIdxLXCol[ xColPb ][ yColPb ] and LX, respectively.
    - Otherwise, mvCol, refIdxCol, and listCol are set equal to mvLNCOL[ xColPb ][ yColPb ], refIdxLNCOL[ xColPb ][ yColPb ], and LN, respectively, with N being the value of collocated_from_l0_flag.

and mvLXCol and availableFlagLXCol are derived as follows:

- The variables curIVFlag and colIVFlag, specifying whether inter-view prediction is utilized for the current and collocated PU are derived as:
  - curIVFlag = LongTermRefPic( currPic, currPb, refIdxLX, LX )  (H-99)
  - colIVFlag = LongTermRefPic( colPic, colPb, refIdxCol, listCol )  (H-100)
- When MvHevcCompatibilityFlag is equal to 0, curIVFlag is not equal to colIVFlag, and AltRefIdxLX is not equal to −1, the variables refIdxCol and colIVFlag are modified as follows:
  - refIdxLX = AltRefIdxLX  (H-101)
  - curIVFlag = LongTermRefPic( currPic, currPb, refIdxLX, LX )  (H-102)
- The motion vector mvLXCol is modified as follows.
- If curIVFlag is not equal to colIVFlag, both components of mvLXCol are set equal to 0 and availableFlagLXCol is set equal to 0.
- Otherwise, the variable availableFlagLXCol is set equal to 1, refPicListCol[ refIdxCol ] is set to be the picture with reference index refIdxCol in the reference picture list listCol of the slice containing prediction block currPb in the picture colPic, and the following applies:
  - The variables colDiff and currDiff specifying a POC or ViewId difference are derived as follows.
    - If curIVFlag is equal to 0 or ( ( ViewIdx != 0 ) && iv_mv_scaling_flag ) is equal to 0, the following applies:
      - colDiff = DiffPicOrderCnt( colPic, refPicListCol[ refIdxCol ] )  (H-103)
      - currDiff = DiffPicOrderCnt( currPic, RefPicListX[ refIdxLX ] )  (H-104)
    - Otherwise, ( curIVFlag is equal to 1 and ( ( ViewIdx != 0 ) && iv_mv_scaling_flag ) is equal to 1), the following applies:
      - colDiff = DiffViewId( colPic, refPicListCol[ refIdxCol ] )  (H-105)
      - currDiff = DiffViewId( currPic, RefPicListX[ refIdxLX ] )  (H-106)
– If \( \text{colDiff is equal to currDiff} \), \( \text{mvLXCol} \) is derived as follows:
\[
\text{mvLXCol} = \text{mvCol}
\]  
(H-107)

– Otherwise, \( \text{mvLXCol} \) is derived as a scaled version of the motion vector \( \text{mvCol} \) as follows:
\[
tx = (16384 + (\text{Abs(} \text{td}) \gg 1)) / \text{td}
\]  
(H-108)
\[
distScaleFactor = \text{Clip3}(-4096, 4095, (\text{tb} \times \text{tx} + 32) \gg 6)
\]  
(H-109)
\[
\text{mvLXCol} = \text{Clip3}(-32768, 32767, \text{Sign}(\text{distScaleFactor} \times \text{mvCol}) \times ((\text{Abs}(\text{distScaleFactor} \times \text{mvCol}) + 127) \gg 8))
\]  
(H-110)

where \( \text{td} \) and \( \text{tb} \) are derived as follows:
\[
\text{td} = \text{Clip3}(-128, 127, \text{colDiff})
\]  
(H-111)
\[
\text{tb} = \text{Clip3}(-128, 127, \text{currDiff})
\]  
(H-112)

**H.8.5.3.2.9 Derivation process for chroma motion vectors**

The specifications in subclause 8.5.2.1.9 apply.

**H.8.5.3.2.10 Derivation process for inter-view merge candidates**

This process is not invoked when \( \text{iv_mv_pred_flag[nuh_layer_id]} \) is equal to 0.

Inputs to this process are:

– a luma location \((xPb, yPb)\) of the top-left luma sample of the current prediction unit relative to the top-left luma sample of the current picture,

– variables \(nPbW\) and \(nPbH\) specifying the width and the height, respectively, of the current prediction unit,

Outputs of this process are (with \(X\) being 0 or 1, respectively)

– the availability flags availableFlagIvMC, availableFlagIvMCShift and availableFlagIvDC specifying whether the inter-view merge candidates are available,

– the reference indices \(\text{refIdxLXIvMC}, \text{refIdxLXIvMCShift}\) and \(\text{refIdxLXIvDC}\),

– the prediction list utilization flags \(\text{predFlagLXIvMC}, \text{predFlagLXIvMCShift}\) and \(\text{predFlagLXIvDC}\),

– the motion vectors \(\text{mxLXIvMC}, \text{mxLXIvMCShift}\) and \(\text{mxLXIvDC}\),

The temporal inter-view motion vector merging candidate is derived by the following ordered steps.

1. The derivation process for a sub prediction block temporal inter-view motion vector candidate as specified in subclause H.8.5.3.2.16 is invoked with the luma location \((xPb, yPb)\), the variables \(nPbW\) and \(nPbH\), the view order index \(\text{RefViewIdx}[xPb][yPb]\) and the disparity vector \(\text{MvRefinedDisp}[xPb][yPb]\) as the inputs and the outputs are, with \(X\) being in the range of 0 to 1, inclusive, the flag \(\text{availableFlagLXIvMC}\), the motion vector \(\text{mxLXIvMC}\) and the reference index \(\text{refIdxLXIvMC}\).

2. The availability flag \(\text{availableFlagIvMC}\), and the prediction utilization flags \(\text{predFlagL0IvMC}\) and \(\text{predFlagL1IvMC}\) are derived by
\[
\text{availableFlagIvMC} = \text{availableFlagL0IvMC} || \text{availableFlagL1IvMC}
\]  
(H-113)
\[
\text{predFlagL0IvMC} = \text{availableFlagL0IvMC}
\]  
(H-114)
\[
\text{predFlagL1IvMC} = \text{availableFlagL1IvMC}
\]  
(H-115)

The shifted temporal inter-view motion vector merging candidate is derived by the following ordered steps.

1. For the prediction list indication \(X\) being 0 and 1 the following applies.

   – The derivation process for a temporal inter-view motion vector candidate as specified in subclause H.8.5.3.2.11 is invoked with the luma location \((xPb, yPb)\), the variables \(nPbW\) and \(nPbH\), the prediction list indication \(X\), the view order index \(\text{RefViewIdx}[xPb][yPb]\), the disparity vector \(\text{MvRefinedDisp}[xPb][yPb] + (nPbW*2 + 4, nPbH*2 + 4)\), and the reference index \(\text{refIdxLX}\) being equal to \(-1\), and as the inputs and the outputs are the flag \(\text{availableFlagLXIvMCShift}\), the motion vector \(\text{mxLXIvMCShift}\) and the reference index \(\text{refIdxLXIvMCShift}\).

2. The availability flag \(\text{availableFlagIvMCShift}\), and the prediction utilization flags \(\text{predFlagL0IvMCShift}\) and \(\text{predFlagL1IvMCShift}\) are derived by
The disparity inter-view motion vector merging candidate is derived by the following ordered steps.

1. For the prediction list indication X being 0 and 1 the following applies.
   - The derivation process for a disparity inter-view motion vector candidate as specified in subclause H.8.5.3.2.12 is invoked with the luma location (xPb, yPb), the view order index RefViewIdx[xPb][yPb], the disparity vector MvRefinedDisp[xPb][yPb], and the prediction list indication X, as the inputs and the outputs are the flag availableFlagLXInterView, the motion vector mvLXInterView, and the reference index refIdxLXInterView.

2. The availability flag availableFlagLXDC, and the prediction utilization flags predFlagL0XDC and predFlagL1XDC are derived by
   - availableFlagLXDC = availableFlagL0XDC | availableFlagL1XDC
   - predFlagL0XDC = availableFlagL0XDC
   - predFlagL1XDC = availableFlagL1XDC

H.8.5.3.2.11 Derivation process for a temporal inter-view motion vector candidate

This process is not invoked when iv_mv_pred_flag[nuh_layer_id] is equal to 0.

Inputs to this process are:

- a luma location (xPb, yPb) of the top-left luma sample of the current prediction unit relative to the top-left luma sample of the current picture,
- variables nPbW and nPbH specifying the width and the height, respectively, of the current prediction unit,
- a prediction list indication X,
- a disparity vector mvDisp,
- a reference view index refViewIdx.

Outputs of this process are:

- a flag availableFlagLXInterView specifying whether the temporal inter-view motion vector candidate is available,
- a temporal inter-view motion vector candidate mvLXInterView,
- a reference index refIdxLX specifying a reference picture in the reference picture list RefPicListLX.

The flag availableFlagLXInterView is set equal to 0, the variable refIdxLX is set equal to –1, and both components of mvLXInterView are set equal to 0.

When X is equal to 1 and the current slice is not a B slice the whole decoding process specified in this subclause terminates.

The reference layer luma location (xRef, yRef) is derived by

\[
\begin{align*}
\text{xRefFull} & = xPb + (nPbW >> 1) + (\text{mvDisp}[0] + 2) >> 2) \\
\text{yRefFull} & = yPb + (nPbH >> 1) + (\text{mvDisp}[1] + 2) >> 2) \\
\text{xRef} & = \text{Clip3}(0, \text{PicWidthInSamples}_{L} - 1, (\text{xRefFull} >> 3) << 3) \\
\text{yRef} & = \text{Clip3}(0, \text{PicHeightInSamples}_{L} - 1, (\text{yRefFull} >> 3) << 3)
\end{align*}
\]

The variable ivRefPic is set equal to the picture with ViewIdx equal to refViewIdx in the current access unit.

The variable ivRefPb specifies the luma prediction block covering the location given by (xRef, yRef) inside the inter-view reference picture specified by ivRefPic.

The luma location (xIvRefPb, yIvRefPb) is set equal to the top-left sample of the inter-view reference luma prediction block specified by ivRefPb relative to the top-left luma sample of the inter-view reference picture specified by ivRefPic.

When ivRefPb is not coded in an intra prediction mode, the following applies, for Y in the range of X to (1 – X), inclusive:
The variables refPicListLYIvRef, predFlagLYIvRef[ x ][ y ], mvLYIvRef[ x ][ y ], and refIdxLYIvRef[ x ][ y ] are set equal to the corresponding variables of the inter-view reference picture specified by ivRefPic, RefPicListLY, PredFlagLY[ x ][ y ], MvLY[ x ][ y ], and RefIdxLY[ x ][ y ], respectively.

When predFlagLYIvRef[ xIvRefPb ][ yIvRefPb ] is equal to 1, the following applies for each i from 0 to num_ref_idx_LX_active_minus1, inclusive:

- When PicOrderCnt( refPicListLYIvRef[ xIvRefPb ][ yIvRefPb ] ) is equal to PicOrderCnt( RefPicListLX[ i ] ) and availableFlagLXInterView is equal to 0, the following applies:
  
  \[
  \text{availableFlagLXInterView} = 1 \quad (H-126)
  \]
  \[
  \text{mvLXInterView} = \text{mvLYIvRef[ xIvRefPb ][ yIvRefPb ]} \quad (H-127)
  \]
  \[
  \text{refIdxLX} = i \quad (H-128)
  \]

H.8.5.3.2.12 Derivation process for a disparity inter-view motion vector candidate

This process is not invoked when iv_mv_pred_flag[ huh_layer_id ] is equal to 0.

Inputs to this process are:

- a luma location ( xPb, yPb ) of the top-left luma sample of the current prediction unit relative to the top-left luma sample of the current picture,
- variables nPbW and nPbH specifying the width and the height, respectively, of the current prediction unit,
- a prediction list indication X,
- a reference view index refViewIdx,
- a disparity vector mvDisp,

Outputs of this process are:

- a flag availableFlagLXInterView specifying whether the disparity inter-view motion vector candidate is available,
- a disparity inter-view motion vector candidate mvLXInterView,
- a reference index refIdxLX specifying a reference picture in the reference picture list RefPicListLX.

The flag availableFlagLXInterView is set equal to 0, both components of mvLXInterView are set equal to 0.

When X is equal to 1 and the current slice is not a B slice the whole decoding process specified in this subclause terminates.

For each i from 0 to num_ref_idx_LX_active_minus1, inclusive, the following applies:

- When PicOrderCnt( RefPicListLX[ i ] ) is equal to the PicOrderCntVal, ViewIdx( RefPicListLX[ i ] ) is equal to refViewIdx and availableFlagLXInterView is equal to 0 the following applies:
  
  \[
  \text{availableFlagLXInterView} = 1 \quad (H-129)
  \]
  \[
  \text{mvLXInterView[ 0 ]} = \text{DepthFlag} \, ? \, (\text{mvDisp[ 0 ]} + 2) \, >> \, 2 : \, \text{mvDisp[ 0 ]} \quad (H-130)
  \]
  \[
  \text{mvLXInterView[ 1 ]} = 0 \quad (H-131)
  \]
  \[
  \text{refIdxLX} = i \quad (H-132)
  \]

H.8.5.3.2.13 Derivation process for a view synthesis prediction merge candidate

Inputs to this process are:

- a luma location ( xCb, yCb ) of the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,

Outputs of this process are:

- the availability flag availableFlagVSP whether the VSP merge candidate is available,
- the reference indices refIdxL0VSP and refIdxL1VSP ,
- the prediction list utilization flags predFlagL0VSP and predFlagL1VSP ,
- the motion vectors mvL0VSP and mvL1VSP.

The variable availableFlagVSP is set equal to 1, the variables predFlagL0VSP and predFlagL1VSP are set equal to 0, the
variables refIdxL0VSP and refIdxL1VSP are set equal to \(-1\) and the variable refViewAvailableFlag is set equal to 0.

- For \(X\) in the range of 0 to 1, inclusive, the following applies:
  - For \(i\) in the range of 0 to \(\text{NumRefPicsLX} - 1\), inclusive, the following applies:
    - When refViewAvailableFlag is equal to 0 and ViewIdx(RefPicListX[\(i\)]) is equal to RefViewIdx[xCb][yCb], the following applies:
      \[
      \begin{align*}
      \text{refViewAvailableFlag} &= 1 \\
      \text{predFlagLXVSP} &= 1 \\
      \text{mvLXVSP} &= \text{MvDisp}[xCb][yCb] \\
      \text{refIdxLXVSP} &= \text{refViewAvailableFlag} = 1
      \end{align*}
      \] (H-133)

When the current slice is a B slice and refViewAvailableFlag is equal to 1, refViewAvailableFlag is set equal to 0 and the following applies:

- For \(i\) in the range of 0 to \(\text{NumRefPicsLY} - 1\), inclusive, the following applies.
  - When refViewAvailableFlag is equal to 0 and ViewIdx(RefPicListY[\(i\)]) is not equal to RefViewIdx[xCb][yCb] and ViewIdx(RefPicListY[\(i\)]) is not equal to ViewIdx, the following applies:
    - The variables refViewAvailableFlag, predFlagLYVSP, mvLYVSP, and refIdxLYVSP are derived as specified in the following:
      \[
      \begin{align*}
      \text{refViewAvailableFlag} &= 1 \\
      \text{predFlagLYVSP} &= 1 \\
      \text{mvLYVSP} &= \text{MvDisp}[xCb][yCb] \\
      \text{refIdxLYVSP} &= \text{refViewAvailableFlag} = 1
      \end{align*}
      \] (H-138)

H.8.5.3.2.14 Derivation process for the texture merging candidate

This process is not invoked when mpi_flag[nuh_layer_id] is equal to 0.

Inputs to this process are:
- a luma location \((xPb, yPb)\) of the top-left luma sample of the current prediction unit relative to the top-left luma sample of the current picture,
- variables nPbW and nPbH specifying the width and the height, respectively, of the current prediction unit,

Outputs of this process are:
- a flag availableFlagT specifying whether the texture merging candidate is available,
- the prediction utilization flags predFlagL0T and predFlagL1T,
- the reference indices refIdxL0T and refIdxL1T (when availableFlagT is equal to 1),
- the motion vectors mvL0T and mvL1T (when availableFlagT is equal to 1).

The variable availableFlagT is set equal to 0. The variables predFlagL0T and predFlagL1T are set equal to 0. The variables refIdxL0T and refIdxL1T are set equal to \(-1\). Both components of the motion vectors mvL0T and mvL1T are
set equal to 0.

The texture luma location \((x_{Ref}, y_{Ref})\) is derived by:

\[
x_{RefFull} = x_{Pb} + ((nPbW - 1) >> 1)
\]

\[
y_{RefFull} = y_{Pb} + ((nPbH - 1) >> 1)
\]

\[
x_{Ref} = \text{Clip3}(0, \text{PicWidthInSamples}_L - 1, (x_{RefFull} >> 3) << 3)
\]

\[
y_{Ref} = \text{Clip3}(0, \text{PicHeightInSamples}_L - 1,(y_{RefFull} >> 3) << 3)
\]

[Ed. (GT): Is clipping necessary?]

Let textPic be the picture with PicOrderCntVal and ViewIdx equal to PicOrderCnt and ViewIdx of the current picture and DepthFlag being equal to 0 and let textPU be the PU at covering the position \((x_{Ref}, y_{Ref})\) in textPic.

For \(X\) in the range of 0 to 1, inclusive, the following applies:

1. The variable textPredFlagLX is set equal to PredFlagLX of textPU. The variable textRefIdxLX is set equal to RefIdxLX of textPU. The variable textMvLX is set equal to the MvLX of textPU. The variable availableFlag is set equal to 0.

2. When \(X\) is equal to 0 or the current slice is a B slice, for \(i\) in the range of 0 to NumRefPicsLX - 1, inclusive, the following applies:
   - When all of the following conditions are true, availableFlag is set equal to 1,
     - textPredFlagLX\[x_{Ref}\][y_{Ref}] is equal to 1
     - PicOrderCnt(RefPicListX[i]) is equal to PicOrderCnt(textPic)
     - ViewIdx(RefPicListX[i]) is equal to ViewIdx(textPic)
   - When predFlagLXT is equal to 0 and availableFlag is equal to 1, the following applies:
     - \(\text{mvLXT[0]} = (\text{textMvLX}[x_{Ref}][y_{Ref}][0] + 2) >> 2\)
     - \(\text{mvLXT[1]} = (\text{textMvLX}[x_{Ref}][y_{Ref}][1] + 2) >> 2\)
     - \(\text{refIdxLX} = i\)
     - \(\text{predFlagLXT} = 1\)
     - availableFlagT = 1

**H.8.5.3.2.15 Derivation process for the shifted disparity merging candidate**

This process is not invoked when DepthFlag is equal to 1.

Inputs to this process are:
- a luma location \((x_{Pb}, y_{Pb})\) of the top-left luma sample of the current prediction unit relative to the top-left luma sample of the current picture,
- variables nPbW and nPbH specifying the width and the height, respectively, of the current prediction unit,
- the availability flags availableFlagN,
- the reference indices refIdxL0N and refIdxL1N,
- the prediction list utilization flags predFlagL0N and predFlagL1N,
- the motion vectors mvL0N and mvL1N,
- a merging candidate list mergeCandList,
- the variable numMergeCand specifying the number of merge candidates in list mergeCandList

Outputs of this process are:
- the flag availableFlagIvDCShift, specifying whether shifted disparity merging candidate is available
- the prediction utilization flags predFlagL0IvDCShift and predFlagL1IvDCShift,
- the reference indices refIdxL0IvDCShift and refIdxL1IvDCShift,
- the motion vectors mvL0IvDCShift and mvL1IvDCShift.
The variable availableFlagIvDCShift is set equal to 0 and for \( i \) in the range of 0 to numMergeCand - 1, inclusive, the following applies:

- The variable \( N \) is set equal to \( \text{mergeCandList}[i] \).
- The derivation process for a view synthesis prediction flag as specified in subclause H.8.5.3.2.17 is invoked with the luma location \((xPb, yPb)\), the variables \( nPbW \) and \( nPbH \), the merge candidate indicator \( N \) as the inputs, and the output is the \( \text{mergeCandIsVspFlag} \).
- When availableFlagIvDCShift is equal to 0 and availableFlagN is equal to 1, the candidate \( N \) is not equal to IvMC or IvDC, and mergeCandIsVspFlag is not equal to 0, predFlagL0N is equal to 1 and ViewIdx( RefPicList0[ refIdxL0N ] ) is not equal to ViewIdx, the following applies:
  - availableFlagIvDCShift is set equal to 1
  - predFlagLXivDCShift is set equal to predFlagLXN, (with \( X \) being replaced by 0 and 1)
  - refIdxLXivDCShift is set equal to refIdxLXN, (with \( X \) being replaced by 0 and 1)
  - mvL0IvDCShift[0] is set equal to mvL0N[0] + 4
  - mvL0IvDCShift[1] is set equal to ( view_synthesis_pred_flag[ nuh_layer_id ] ? 0 : mvL0N[1] )
  - mvL1IvDCShift = mvL1N

When availableFlagIvDCShift is equal to 0 and availableFlagIvDC is equal to 1, availableFlagIvDCShift is set to 1 and the following applies for \( X \) being 0 to 1, inclusive:

- predFlagLXivDCShift is set equal to predFlagLXivDC,
- refIdxLXivDCShift is set equal to refIdxLXivDC,
- mvLXivDCShift[0] is set equal to mvL0ivDC[0] + 4
- mvLXivDCShift[1] is set equal to mvL0ivDC[1]

### H.8.5.3.2.16 Derivation process for a sub prediction block temporal inter-view motion vector candidate

This process is not invoked when iv_mv_pred_flag[ nuh_layer_id ] is equal to 0.

Inputs to this process are:

- a luma location \((xPb, yPb)\) of the top-left luma sample of the current prediction unit relative to the top-left luma sample of the current picture,
- variables \( nPbW \) and \( nPbH \) specifying the width and the height, respectively, of the current prediction unit,
- a reference view index refViewIdx.
- a disparity vector \( mvDisp \).

Outputs of this process are:

- the flags availableFlagLXInterView, with \( X \) in the range of 0 to 1, inclusive, specifying whether the temporal inter-view motion vector candidate is available,
- the temporal inter-view motion vector candidate \( mvLXInterView \), with \( X \) in the range of 0 to 1, inclusive.
- the reference index refIdxLXInterView, with \( X \) in the range of 0 to 1, inclusive, specifying a reference picture in the reference picture list RefPicListLX,

For \( X \) in the range of 0 to 1, inclusive, the following applies:

- The flag availableFlagLXInterView is set equal to 0.
- The motion vector \( mvLXInterView \) is set equal to \((0, 0)\).
- The reference index refIdxLXInterView is set equal to \(-1\).

The variables \( nSBW \) and \( nSBH \) are derived as:

\[
\text{nSBW} = nPbW / \text{SubPbSize}[\text{nuh_layer_id}] \leq 1 \times nPbW : \text{SubPbSize}[\text{nuh_layer_id}] \quad (H-157)
\]

\[
\text{nSBH} = nPbH / \text{SubPbSize}[\text{nuh_layer_id}] \leq 1 \times nPbH : \text{SubPbSize}[\text{nuh_layer_id}] \quad (H-158)
\]

The variable ivRefPic is set equal to the picture with ViewIdx equal to refViewIdx in the current access unit, the variable curSubBlockIdx is set equal to 0 and the variable lastAvailableFlag is set equal to 0.
For yBlk in the range of 0 to \((n_{PbH} / n_{SbH} – 1)\), inclusive, the following applies:

- For xBlk in the range of 0 to \((n_{PbW} / n_{SbW} – 1)\), inclusive, the following applies:
  - For \(X\) in the range of 0 to 1, inclusive, the derivation process for a temporal inter-view motion vector candidate as specified in subclause 8.5.3.2.11 is invoked with the luma location \((x_{Pb} + x_{Blk} * n_{SbW}, y_{Pb} + y_{Blk} * n_{SbH})\), the variables \(n_{SbW}\) and \(n_{SbH}\), the prediction list indication \(X\), the view order index \(refViewId\), and the disparity vector \(mvDisp\) as the inputs and the outputs are the flag \(spPredFlagL[X][x_{Blk}][y_{Blk}]\), the motion vector \(spMvL[X][x_{Blk}][y_{Blk}]\) and the reference index \(spRefIdxL[X][x_{Blk}][y_{Blk}]\).
  - The variable \(curAvailableFlag\) is set equal to \((spRefIdxL0[x_{Blk}][y_{Blk}] || spRefIdxL1[x_{Blk}][y_{Blk}]\).
  - Depending on \(curAvailableFlag\), the following applies:
    - If \(curAvailableFlag\) is equal to 1, the following ordered steps apply:
      1. When lastAvailableFlag is equal to 0, the following applies:
        - For \(X\) in the range of 0 to 1, inclusive, the following applies:
          - The variables \(i\) and \(k\) are derived as specified in the following:
            
            \[
            i = k \% (n_{PbW} / n_{SbW})
            \]
            (H-162)
            
            \[
            j = k / (n_{PbW} / n_{SbW})
            \]
            (H-163)

        - For \(X\) in the range of 0 to 1, inclusive, the following applies:
          
          \[
          spMvL[X][i][j] = spMvL[X][x_{Blk}][y_{Blk}]
          \]
          (H-164)
          
          \[
          spRefIdxL[X][i][j] = spRefIdxL[X][x_{Blk}][y_{Blk}]
          \]
          (H-165)
          
          \[
          spPredFlagL[X][i][j] = spPredFlagL[X][x_{Blk}][y_{Blk}]
          \]
          (H-166)

          2. The variable \(lastAvailableFlag\) is set equal to 1.
          3. The variables \(xLastAvail\) and \(yLastAvail\) are set equal to \(x_{Blk}\) and \(y_{Blk}\), respectively.
        - Otherwise (\(curAvailableFlag\) is equal to 0), when lastAvailable Flag is equal to 1, the following applies for \(X\) in the range of 0 to 1, inclusive:
          
          \[
          spMvL[X][x_{Blk}][y_{Blk}] = spMvL[X][x_{LastAvail}][y_{LastAvail}]
          \]
          (H-167)
          
          \[
          spRefIdxL[X][x_{Blk}][y_{Blk}] = spRefIdxL[X][x_{LastAvail}][y_{LastAvail}]
          \]
          (H-168)
          
          \[
          spPredFlagL[X][x_{Blk}][y_{Blk}] = spPredFlagL[X][x_{LastAvail}][y_{LastAvail}]
          \]
          (H-169)

          - The variable \(curSubBlockIdx\) is set equal to \(curSubBlockIdx + 1\).

For use in derivation processes of variables invoked later in the decoding process, the following assignments are made for \(x = 0..n_{PbW} – 1\) and \(y = 0..n_{PbH} – 1\):

- For \(X\) in the range of 0 to 1, inclusive, the following applies:
  - The variables \(SubPbPredFlagL[X]\), \(SubPbMvL[X]\) and \(SubPbRefIdxL[X]\) are derived as specified in following:
    
    \[
    SubPbPredFlagL[X][x_{Pb} + x][y_{Pb} + y] = spPredFlagL[X][x / n_{SbW}][y / n_{SbW}]
    \]
    (H-170)
    
    \[
    SubPbMvL[X][x_{Pb} + x][y_{Pb} + y] = spMvL[X][x / n_{SbW}][y / n_{SbW}]
    \]
    (H-171)
    
    \[
    SubPbRefIdxL[X][x_{Pb} + x][y_{Pb} + y] = spRefIdxL[X][x / n_{SbW}][y / n_{SbW}]
    \]
    (H-172)

  - The derivation process for chroma motion vectors in subclause 8.5.3.2.9 is invoked with \(SubPbMvL[X][x_{Pb} + x][y_{Pb} + y]\) as input and the output is \(SubPbMvCL[X][x_{Pb} + x][y_{Pb} + y]\).
H.8.5.3.2.17 Derivation process for a view synthesis prediction flag

Inputs to this process are:
- a luma location \((x_{PB}, y_{PB})\) of the top-left luma sample of the current prediction unit relative to the top-left luma sample of the current picture,
- variables \(n_{PBW}\) and \(n_{PBH}\) specifying the width and the height, respectively, of the current prediction unit,
- a merge candidate indicator \(N\), specifying the merge candidate.

Outputs of this process are:
- a variable \(mergeCandIsVspFlag\) specifying, whether the merge candidate is a view synthesis prediction merge candidate.

The variable \(mergeCandIsVspFlag\) is derived as specified in the following:

- If \(N\) is equal to \(VSP\), \(mergeCandIsVspFlag\) is set equal to 1,
- Otherwise, if \(N\) is equal to \(A_1\), \(mergeCandIsVspFlag\) is set equal to \(VspModeFlag[x_{PB} - 1][y_{PB} + n_{PBH} - 1]\),
- Otherwise, if \(N\) is equal to \(A_0\), \(mergeCandIsVspFlag\) is set equal to \(VspModeFlag[x_{PB} - 1][y_{PB} + n_{PBH}]\),
- Otherwise, \(mergeCandIsVspFlag\) is set equal to 0.

H.8.5.3.2.18 Derivation process for the base merge candidate list

The specifications in subclause 8.5.3.2.1 apply, with the following modifications:

- Steps 9 and 10 are removed.
- “When slice_type is equal to B, the derivation process for combined bi-predictive merging candidates” is replaced by “When slice_type is equal to B and numMergeCand is less than 5, the derivation process for combined bi-predictive merging candidates”
- “temporal luma motion vector prediction in subclause 8.5.3.2.7 is invoked” is replaced by “temporal luma motion vector prediction in subclause H.8.5.3.2.7 is invoked”
- The outputs of the process are replaced by:
  - a modified luma location \((x_{PC}, y_{PC})\) of the top-left sample of the current luma prediction block relative to the top-left luma sample of the current picture,
  - two variables \(n_{PBW}\) and \(n_{PBH}\) specifying the modified width and the height of the luma prediction block,
  - a modified variable partIdx specifying the modified index of the current prediction unit within the current coding unit,
  - an original luma location \((x_{OrigP}, y_{OrigP})\) of the top-left sample of the current luma prediction block relative to the top-left luma sample of the current picture,
  - two variables \(n_{OrigPbW}\) and \(n_{OrigPbH}\) specifying the original width and the height of the luma prediction block,
  - the merge candidate list, \(mergeCandList\),
  - the luma motion vectors \(mvL0N\) and \(mvL1N\), with \(N\) being replaced by all entries of \(mergeCandList\)
  - the reference indices \(refIdxL0N\) and \(refIdxL1N\), with \(N\) being replaced by all entries of \(mergeCandList\)
  - the prediction list utilization flags \(predFlagL0N\) and \(predFlagL1N\), with \(N\) being replaced by all elements of \(mergeCandList\)

H.8.5.3.3 Decoding process for inter prediction samples

H.8.5.3.3.1 General

Inputs to this process are:
- a luma location \((x_{Cb}, y_{Cb})\) specifying the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a luma location \((x_{BL}, y_{BL})\) specifying the top-left sample of the current luma prediction block relative to the top-left sample of the current luma coding block,
– a variable nCbS specifying the size of the current luma coding block,
– two variables nPbW and nPbH specifying the width and the height of the luma prediction block,
– the luma motion vectors mvL0 and mvL1,
– the chroma motion vectors mvCL0 and mvCL1,
– the reference indices refIdxL0 and refIdxL1,
– the prediction list utilization flags, predFlagL0, and predFlagL1.

Outputs of this process are:

– an (nCbS_x)(nCbS_y) array predSampleL0 of luma prediction samples, where nCbS_x is derived as specified below,
– an (nCbS_x)(nCbS_y) array predSampleL1 of chroma prediction samples for the component Cb, where nCbS_y is derived as specified below,
– an (nCbS_x)(nCbS_y) array predSampleLr of chroma residual samples for the component Cr, where nCbS_y is derived as specified below.

The variable nCbS_x is set equal to nCbS and the variable nCbS_y is set equal to nCbS >> 1.

- If VspModeFlag[xCb + xBl][yCb + yBl] is equal to 0, the following ordered steps apply:

  1. Let predSampleL0, predSampleL1, be (nPbW)(nPbH) arrays of predicted luma sample values and predSampleLr, predSampleL1Cr, and predSampleL1Cr be (nPbW / 2)(nPbH / 2) arrays of predicted chroma sample values.

  2. For X being each of 0 and 1, when predFlagLX is equal to 1, the following applies:

     - When predFlagLX is equal to 1, the following applies:

       - The variable resPredFlag is derived as specified in the following: [Ed. (CY): Based on F0123, the only check for resPredFlag is the iv_res_pred_weight_idx, however F015 introduces other checks for ARP, which may apply to temporal residual prediction. The additional checks in H.195 need to be closely inspected.]

         \[
         \text{resPredFlag} = \left( \text{iv_res_pred_weight_idx} \neq 0 \right) \&\& \text{RefRpRefPicAvailFlagLX} \&\& \\
         \hspace{1cm} \text{RefViewIdx}[\text{xP}][\text{yP}] \\
         \]  

       - If resPredFlag is equal to 1, the bilinear sample interpolation and residual prediction process as specified in subclause H.8.5.3.3.7 is invoked with the luma locations (xCb, yCb), (xBl, yBl), the size of the current luma coding block nCbS, the width and the height of the current luma prediction block nPbW, nPbH, the prediction list indication X, the prediction list utilization flag predFlagLX, the reference index refIdxLX, and the motion vectors mvLX, mvCLX, as the inputs and the outputs are the arrays predSampleLxLX, predSampleLxCr, and predSampleLxCr.

       - Otherwise, (resPredFlag is equal to 0), the following applies:

         - The reference picture consisting of an ordered two-dimensional array refPicLxLX of luma samples and two ordered two-dimensional arrays refPicLxCb and refPicLxCr of chroma samples is derived by invoking the process specified in subclause 8.5.3.3.2 with refIdxLX as input.

         - If DepthFlag is equal to 0, the arrays predSampleLxLX, predSampleLxCb, and predSampleLxCr are derived by invoking the fractional sample interpolation process specified in subclause 8.5.3.3.3 with the luma locations (xCb, yCb) and (xBl, yBl), the luma prediction block width nPbW, the luma prediction block height nPbH, the motion vectors mvLX and mvCLX, and the reference arrays refPicLxLX, refPicLxCb, and refPicLxCr as inputs.

         - Otherwise, (DepthFlag is equal to 1), arrays predSampleLxLX, predSampleLxCb, and predSampleLxCr are derived by invoking the full sample interpolation process specified in subclause H.8.5.3.3.5 with the luma locations (xCb, yCb), (xBl, yBl), the width and the height of the current luma prediction block nPbW, nPbH, the motion vectors mvLX, mvCLX, and the reference arrays with refPicLxLX, refPicLxCb, and refPicLxCr given as input.

 3. Depending on ic_flag, the array predSampleL is derived as specified in the following:

    - If ic_flag is equal to 0, the following applies:

      - The array predSampleL of the prediction samples of luma component is derived by invoking the weighted sample prediction process specified in subclause 8.5.3.3.4 with the luma prediction block
width nPbW, the luma prediction block height nPbH, and the sample arrays predSamplesL0, and predSamplesL1, and the variables predFlagL0, predFlagL1, refIdxL0, refIdxL1, and cldx equal to 0 as inputs. [Ed. (GT): There seems to be an issue with the base spec. In this subclause predSample\_L\_Cb is of size (nCbS\_L)(nCbS\_L), whereas the output of 8.5.3.3.4 is of size (nPbW)(nPbH).]

- Otherwise (ic\_flag is equal to 1), the following applies,
  - The array predSample\_L of the prediction samples of luma component is derived by invoking the illumination compensated sample prediction process specified in subclause H.8.5.3.3.6, with the luma location (xBl, yBl), the size of the current luma coding block nCbS, the luma location (xBl, yBl), the width and the height of the current luma prediction block nPbW, nPbH, and the sample arrays predSamplesL0, and predSamplesL1, as well as predFlagL0, predFlagL1, refIdxL0, refIdxL1, mvL0, mvL1, and cldx equal to 0 given as input.

4. Depending on ic\_flag and nPbW, the arrays predSample\_Cb, and predSample\_Cr are derived as specified in the following:

- If ic\_flag is equal to 0 or nPbW is not greater than 8, the following applies:
  - The array predSample\_Cb of the prediction samples of component Cb is derived by invoking the weighted sample prediction process specified in subclause 8.5.3.3.4 with the chroma prediction block width nPbW\_Cb \set nPbW/2, the chroma prediction block height nPbH\_Cb \set nPbH/2, the sample arrays predSamplesL0\_Cb and predSamplesL1\_Cb, and the variables predFlagL0, predFlagL1, refIdxL0, refIdxL1, and cldx equal to 1 as inputs.
  - The array predSample\_Cr of the prediction samples of component Cr is derived by invoking the weighted sample prediction process specified in subclause 8.5.3.3.4 with the chroma prediction block width nPbW\_Cr \set nPbW/2, the chroma prediction block height nPbH\_Cr \set nPbH/2, the sample arrays predSamplesL0\_Cr and predSamplesL1\_Cr, and the variables predFlagL0, predFlagL1, refIdxL0, refIdxL1, and cldx equal to 2 as inputs.

- Otherwise (ic\_flag is equal to 1 and nPbW is greater than 8), the following applies:
  - The array predSample\_Cb of the prediction samples of component Cb is derived by invoking the illumination compensated sample prediction process specified in subclause H.8.5.3.3.6, with the luma location (xBl, yBl), the size of the current luma coding block nCbS, the luma location (xBl/2, yBl/2), the width and the height of the current chroma prediction block nPbW\_Cb \set nPbW/2, nPbH\_Cb \set nPbH/2, and the sample arrays predSamplesL0\_Cb and predSamplesL1\_Cb as well as predFlagL0, predFlagL1, refIdxL0, refIdxL1, mvL0, mvL1, and cldx equal to 1 given as input.
  - The array predSample\_Cr of the prediction samples of component Cr is derived by invoking the illumination compensated sample prediction process specified in subclause H.8.5.3.3.6, with the luma location (xBl, yBl), the size of the current luma coding block nCbS, the luma location (xBl/2, yBl/2), the width and the height of the current chroma prediction block nPbW\_Cr \set nPbW/2, nPbH\_Cr \set nPbH/2, and the sample arrays predSamplesL0\_Cr and predSamplesL1\_Cr as well as predFlagL0, predFlagL1, refIdxL0, refIdxL1, mvL0, mvL1, and cldx equal to 2 given as input.

- Otherwise, (VspModeFlag[ xCb + xBl ] \& yCb + yBl ] is equal to 1), the following applies:
  - For X in the range of 0 to 1, inclusive, the following applies.
    - When predFlagLX is equal to 1, the arrays predSamplesL0, predSample\_Cb, and predSample\_Cr are derived by invoking the view synthesis prediction process as specified in subclause H.8.5.3.3.7.3, with the luma locations (xBl, yBl), (xBl/2, yBl/2), and the width and the height of the current luma prediction block nPbW, nPbH, the prediction list indicator X and the reference index refIdxLX as the inputs and the outputs are the sample arrays predSamplesLX, predSample\_LX, and predSamplesLX.
    - The array predSample\_L of the prediction samples of luma component is derived by invoking the weighted sample prediction process specified in subclause 8.5.2.2.3 with the luma location (xBl, yBl), the width and the height of the current luma prediction block nPbW, nPbH, and the sample arrays predSamplesL0\_L and predSamplesL1\_L as well as predFlagL0, predFlagL1, refIdxL0, refIdxL1, and cldx equal to 0 given as input.
    - The array predSample\_Cb of the prediction samples of component Cb is derived by invoking the weighted sample prediction process specified in subclause 8.5.2.2.3 with the chroma location (xBl/2, yBl/2), the width and the height of the current chroma prediction block nPbW\_Cb \set nPbW/2, nPbH\_Cb \set nPbH/2, and the sample arrays predSamplesL0\_Cb and predSamplesL1\_Cb as well as predFlagL0, predFlagL1, refIdxL0, refIdxL1, and cldx equal to 1 given as input.
The array predSampleLX of the prediction samples of component Cr is derived by invoking the weighted sample prediction process specified in subclause 8.5.2.2.3 with the chroma location \((xBl, yBl)\), the width and the height of the current chroma prediction block \(nPbW\), \(nPbH\), set equal to \(nPbW/2\), \(nPbH/2\), and the sample arrays predSamplesL0C, and predSamplesL1C, as well as predFlagL0, predFlagL1, refIdxL0, refIdxL1, and cIdx equal to 2 given as input.

**H.8.5.3.3.2 Reference picture selection process**

The specifications in subclause 8.5.3.2.2 apply.

**H.8.5.3.3.3 Fractional sample interpolation process**

The specifications in subclause 8.5.3.3.3 apply.

**H.8.5.3.3.4 Weighted sample prediction process**

The specifications in subclause 8.5.3.3.4 apply.

**H.8.5.3.3.5 Full sample interpolation process**

Inputs to this process are:

- A luma location \((xCb, yCb)\) specifying the top-left sample of the current luma coding block relative to the top left luma sample of the current picture,
- A luma location \((xBl, yBl)\) specifying the top-left sample of the current luma prediction block relative to the top luma sample of the current luma coding block,
- The width and height of the prediction block, \(nPbW\) and \(nPbH\), in luma-sample units,
- A luma motion vector \(mvLX\) given in quarter-luma-sample units,
- A chroma motion vector \(mvCLX\) given in eighth-chroma-sample units,
- The reference picture sample arrays \(refPicLX_c\), \(refPicLX_{cb}\), and \(refPicLX_{cr}\).

Outputs of this process are:

- A \((nPbW)\times(nPbH)\) array \(predSampleLX\) of prediction luma sample values,
- Two \((nPbW/2)\times(nPbH/2)\) arrays \(predSampleLXC\) and \(predSampleLXC\) of prediction chroma sample values.

The location \((xP, yP)\) given in full-sample units of the upper-left luma samples of the current prediction block relative to the upper-left luma sample location of the given reference sample arrays is derived by

\[
\begin{align*}
xP &= xCb + xBl \quad \text{(H-174)} \\
yP &= yCb + yBl \quad \text{(H-175)}
\end{align*}
\]

Let \((xIntL, yIntL)\) be a luma location given in full-sample units specifying sample locations inside the reference sample arrays \(refPicLX\).

For each luma sample location \((xL = 0..(nPbW - 1), yL = 0..(nPbH - 1))\) inside the prediction luma sample array \(predSampleLX\), the corresponding prediction luma sample value \(predSampleLX[ xL ][ yL ]\) is derived as follows:

- The variables \(xIntL, yIntL\), are derived as specified in the following:

\[
\begin{align*}
xIntL &= xP + mvLX[0] + xL \quad \text{(H-176)} \\
yIntL &= yP + mvLX[1] + yL \quad \text{(H-177)}
\end{align*}
\]

- The prediction luma sample value \(predSampleLX[ xL ][ yL ]\) is derived as specified in the following:

\[
\text{predSampleLX}[ xL ][ yL ] = \text{refPicLX}[ xIntL, yIntL ] \quad \text{(H-178)}
\]

For each chroma sample location \((xC = 0..(nPbW / 2 - 1), yC = 0..(nPbH / 2 - 1))\) inside the prediction chroma sample arrays \(predSampleLXC\) and \(predSampleLXC\), the corresponding prediction chroma sample values \(predSampleLXC[ xC ][ yC ]\) and \(predSampleLXC[ xC ][ yC ]\) are set to be equal to \((1 << (\text{BitDepth}_{c} - 1)))\).

**[Ed. (GT): In current software and draft chroma planes are also present for depth. A general discussion is needed to specify how chroma planes are handled. (**12**)]**

**H.8.5.3.3.6 Illumination compensated sample prediction process**

Inputs to this process are:
- a location \((x_{Cb}, y_{Cb})\) specifying the top-left sample of the current luma coding block relative to the top left sample of the current picture,
- the size of current luma coding block \(n_{CbS}\),
- a location \((x_{Bl}, y_{Bl})\) specifying the top-left sample of the current prediction block relative to the top left sample of the current coding block,
- the width and height of this prediction block, \(n_{PbW}\) and \(n_{PbH}\),
- two \((n_{PbW}) \times (n_{PbH})\) arrays \(\text{predSamplesL0}\) and \(\text{predSamplesL1}\),
- prediction list utilization flags, \(\text{predFlagL0}\) and \(\text{predFlagL1}\),
- reference indices, \(\text{refIdxL0}\) and \(\text{refIdxL1}\),
- motion vector \(\text{mvL0}\) and \(\text{mvL1}\),
- colour component index, \(c_{Idx}\),

Outputs of this process are:
- the \((n_{PbW}) \times (n_{PbH})\) array \(\text{predSamples}\) of prediction sample values.

Variables \(\text{shift1}\), \(\text{shift2}\), \(\text{offset1}\) and \(\text{offset2}\) are derived as follows.
- The variable \(\text{shift1}\) is set equal to \(14 - \text{bitDepth}\) and the variable \(\text{shift2}\) is set equal to \(15 - \text{bitDepth}\),
- The variable \(\text{offset1}\) is derived as follows.
  - If \(\text{shift1}\) is greater than 0, \(\text{offset1}\) set equal to \(1 \ll (\text{shift1} - 1)\).
  - Otherwise (\(\text{shift1}\) is equal to 0), \(\text{offset1}\) is set equal to 0.
- The variable \(\text{offset2}\) is set equal to \(1 \ll (\text{shift2} - 1)\).

The variable \(\text{bitDepth}\) is derived as follows.
- If \(c_{Idx}\) is equal to 0, \(\text{bitDepth}\) is set equal to \(\text{BitDepth}_Y\).
- Otherwise (\(c_{Idx}\) is equal to 1 or 2), \(\text{bitDepth}\) is set equal to \(\text{BitDepth}_C\).

The derivation process for illumination compensation mode availability and parameters as specified in subclause H.8.5.3.3.6.1 is invoked with the luma location \((x_{Cb}, y_{Cb})\), the size of the current luma coding block \(n_{CbS}\), prediction list utilization flags, \(\text{predFlagL0}\) and \(\text{predFlagL1}\), reference indices \(\text{refIdxL0}\) and \(\text{refIdxL1}\), motion vectors \(\text{mvL0}\) and \(\text{mvL1}\), the bit depth of samples, \(\text{bitDepth}\), a variable \(c_{Idx}\) specifying colour component index as the inputs and the outputs are the flags \(\text{puIcFlagL0}\) and \(\text{puIcFlagL1}\) and the variables \(\text{icWeightL0}\) and \(\text{icWeightL1}\) specifying weights for illumination compensation, the variables \(\text{icOffsetL0}\) and \(\text{icOffsetL1}\) specifying offsets for illumination compensation.

Depending on the value of \(\text{predFlagL0}\) and \(\text{predFlagL1}\), the prediction samples \(\text{predSamples}[ x ] [ y ] \) with \(x = 0..(n_{PbW}) - 1\) and \(y = 0..(n_{PbH}) - 1\) are derived as follows:
- For \(X\) in the range of 0 to 1, inclusive, the following applies:
  - When \(\text{predFlagLX}\) is equal to 1 the following applies:
    \[
    \begin{align*}
    \text{clipPredVal} & = \text{Clip3}(0, (1 \ll \text{bitDepth}) - 1, (\text{predSamplesLX}[ x ] [ y ] + \text{offset1}) \gg \text{shift1}) \\
    \text{predValX} & = \text{puIcFlagLX} \ ? \text{clipPredVal} : (\text{Clip3}(0, (1 \ll \text{bitDepth}) - 1, (\text{clipPredVal} * \text{icWeightLX}) \gg 5) + \text{icOffsetLX})
    \end{align*}
    \]
  - If \(\text{predFlagL0}\) is equal to 1 and \(\text{predFlagL1}\) is equal to 1, the following applies:
    \[
    \begin{align*}
    \text{predSamples}[ x ] [ y ] & = \text{Clip3}(0, (1 \ll \text{bitDepth}) - 1, (\text{predVal0} + \text{predVal1} + \text{offset2}) \gg \text{shift2}) \\
    \end{align*}
    \]
  - Otherwise (\(\text{predFlagL0}\) is equal to 0 and \(\text{predFlagL1}\) is equal to 0), the following applies:
    \[
    \begin{align*}
    \text{predSamples}[ x ] [ y ] & = \text{predFlagL0} \ ? \text{predVal0} : \text{predVal1}
    \end{align*}
    \]

H.8.5.3.3.6.1 Derivation process for illumination compensation mode availability and parameters

Inputs to this process are:
- a luma location \((x_{Cb}, y_{Cb})\) specifying the top-left sample of the current coding block relative to the top left sample of the current picture,
– the size of the current luma coding block, nCbS,
– prediction list utilization flags, predFlagL0 and predFlagL1,
– reference indices refIdxL0 and refIdxL1,
– motion vectors mvL0 and mvL1
– a bit depth of samples, bitDepth.
– a variable cIdx specifying colour component index.

Outputs of this process are:
– flags puICFlagL0 and puICFlagL1 specifying whether illumination compensation is enabled.
– variables icWeightL0 and icWeightL1 specifying weights for illumination compensation
– variables icOffsetL0 and icOffsetL1 specifying offsets for illumination compensation

The variables puICFlagL0 and puICFlagL1 are set equal to 0, the variables icWeightL0 and icWeightL1 are set equal to 1, and the variables icOffsetL0 and icOffsetL1 are set equal to 0.

The variables nCS specifying the current luma or chroma coding block size, and the location (xC, yC) specifying the top left sample of the current luma or chroma coding block is derived as follows.

\[
\begin{align*}
nCS &= ( \text{cldx} = 0 ) \times \text{nCbS} : \text{nCbS} / 2 & \quad \text{(H-183)} \\
(xC, yC) &= ( \text{cldx} = 0 ) \times (xC, yCb) : (xC / 2, yCb / 2) & \quad \text{(H-184)}
\end{align*}
\]

The variable availFlagCurAboveRow specifying the availability of above neighbouring row samples is derived by invoking the availability derivation process for a block in z-scan order as specified in subclause 6.4.1 with the location (xC, yC) set equal to (xCb, yCb) and the neighbouring location (xN, yN) set equal to (xCb, yCb – 1) as the input and the output is assigned to availFlagCurAboveRow.

The variable availFlagCurLeftCol specifying the availability of left neighbouring column samples is derived by invoking the availability derivation process for a block in z-scan order as specified in subclause 6.4.1 with the location (xC, yC) set equal to (xCb, yCb) and the neighbouring location (xN, yN) set equal to (xCb – 1, yCb) as the input and the output is assigned to availFlagCurLeftCol.

[Ed. (GT) The availability derivation is specified as performed in the software. However, the check of the availability of left and above PU might not be sufficient to guarantee the availability of the whole left column or above row. A check of availability similar to that used for intra prediction might be a better solution.]

When availFlagCurAboveRow is equal to 0 and availFlagCurLeftCol is equal to 0 the whole derivation process of this subclause terminates.

For X being replaced by 0 and 1, when predFlagLX is equal to 1, the variable puICFlagLX is derived by the following ordered steps.

1. The variable refPicLX specifying the reference picture from reference picture list X is set equal to RefPicListX[refIdxLX].
2. If ViewIdx(refPicLX) is not equal to ViewIdx, the variable puIVPredFlagLX specifying whether inter-view prediction from list X is utilized is set equal to 1, otherwise (predFlagLX is equal to 0 or ViewIdx(RefPicListX[refIdxLX]) is equal to ViewIdx), puIVPredFlagLX is set equal to 0.
3. If puIVPredFlagLX is equal to 0, the variable puICFlagLX is set equal to 0, otherwise (puIVPredFlagLX is equal to 1) the following applies:
   – The luma location (xRLX, yRLX) specifying the top-left sample of the reference block in refPicLX is derived as
     \[
     \begin{align*}
xRLX &= xC + ((\text{mvLX}[0] + (\text{cldx} / 4 : 2))) \gg (2 + (\text{cldx} / 1 : 0)) & \quad \text{(H-185)} \\
yRLX &= yC + ((\text{mvLX}[1] + (\text{cldx} / 4 : 2))) \gg (2 + (\text{cldx} / 1 : 0)) & \quad \text{(H-186)}
\end{align*}
     \]
   – The variable availFlagAboveRowLX specifying whether the above neighbouring row samples of the current block and the reference block are available is derived as specified in the following:
     \[
     \text{availFlagAboveRowLX} = (yRLX > 0) \&\& \text{ availFlagCurAboveRow} \quad \text{(H-187)}
     \]
   – The variable availFlagLeftColLX specifying whether the left neighbouring column samples of the current block and the reference block are available is derived as specified in the following:
3D-HEVC

\( \text{availFlagLeftColLX} = (xRLX > 0) \) \&\& \( \text{ availFlagCurLeftCol } \) (H-188)

- The variable pulcFlagLX is derived as follows:

\( \text{pulcFlagLX} = \text{ availFlagAboveRowLX } \) \&\& \( \text{ availFlagLeftColLX } \) (H-189)

Depending on the colour component clIdx, the variable curRecSamples specifying the reconstructed picture samples of the current picture is derived as

\( \text{curRecSamples} = (\neg \text{ clIdx } ) \? \text{ RecSamplesL } : (\text{ clIdx == 1 } ) \? \text{ RecSamplesCb } : \text{ RecSamplesCr } ) \) (H-190)

[Ed. (GT). The reconstructed samples before deblurring filter RecSamplesL, RecSamplesCb and RecSamplesCr as used above although not explicitly defined. However, they should be defined in the base spec.]

For X being replaced by 0 and 1, when pulcFlagLX is equal to 1, the variables icWeightLX, and icOffsetLX are derived by the following ordered steps:

1. Depending on the colour component clIdx, the variable refRecSamples specifying the reconstructed picture samples of the reference picture is derived as specified in the following.
   - If clIdx is equal to 0, refRecSamples is set equal to reconstructed picture sample array \( S_L \) of picture refPicLX.
   - Otherwise, if clIdx is equal to 1, refRecSamples is set equal to the reconstructed chroma sample array \( S_{Cb} \) of picture refPicLX.
   - Otherwise (clIdx is equal to 2), refRecSamples is set equal to the reconstructed chroma sample array \( S_{Cr} \) of picture refPicLX.

2. The lists curNeighSampleListLX and refNeighSampleListLX specifying the neighbouring samples in the current picture and the reference picture are derived as specified in the following.
   - The variable numNeighSamplesLX specifying the number of elements in curNeighSampleListLX and in refNeighSampleLX is set equal to 0.
   - The variable leftNeighOffLX specifying the offset of the left neighbouring samples in curNeighSampleListLX and refNeighSampleLX is derived as

\( \text{leftNeighOffLX} = \text{ availFlagAboveRowLX } ? 0 : nCS \) (H-191)

   - For i ranging from 0 to nCS – 1, inclusive the following applies.
     - When availFlagAboveRowLX is equal to 1 the following applies.

\( \text{curNeighSampleListLX}[i] = \text{ curRecSamples}[xC + i][yC - 1] \) (H-192)

\( \text{refNeighSampleListLX}[i] = \text{ refRecSamples}[xRLX + i][yRLX - 1] \) (H-193)

\( \text{numNeighSamplesLX} += 1 \) (H-194)

- When availFlagLeftColLX is equal to 1 the following applies

\( \text{curNeighSampleListLX}[i + \text{ leftNeighOffLX } ] = \text{ curRecSamples}[xC - 1][yC + i] \) (H-195)

\( \text{refNeighSampleListLX}[i + \text{ leftNeighOffLX } ] = \text{ refRecSamples}[xRLX - 1][yRLX + i] \) (H-196)

\( \text{numNeighSamplesLX} += 1 \) (H-197)

3. The derivation process for illumination compensation parameters as specified in subclause H.8.5.3.3.6.2 is invoked, with the list of neighbouring samples in the current picture curNeighSampleList, the list of neighbouring samples in the reference picture refNeighSampleList, the number of neighbouring samples numNeighSamplesLX and the size of the current luma coding block nCSl as inputs and the illumination parameters icWeightLX, and icOffsetLX as outputs.

H.8.5.3.3.6.2 Derivation process for illumination compensation parameters

Inputs to this process are:
- a list curSampleList specifying the current samples,
- a list refSampleList specifying the reference samples,
- a variable numSamples specifying the number of elements in curSampleList and refSampleList.
- a bit depth of samples, bitDepth.
the size of the current luma coding block nCSl

Outputs of this process are:

- a variable icWeight specifying a weight for illumination compensation,
- a variable icOffset specifying a offset for illumination compensation,

The variable precShift is set equal to Max( 0, bitDepth - 12 ).

The variables sumRef, sumCur, sumRefSquare and sumProdRefCur are set equal to 0 and the following applies for i ranging from 0 to numSamples / 2-1, inclusive:

\[
\begin{align*}
\text{sumRef} &\text{ += refSampleList[ 2 * i ]} \\
\text{sumCur} &\text{ += curSampleList[ 2 * i ]} \\
\text{sumRefSquare} &\text{ += ( refSampleList[ 2 * i ] * refSampleList[ 2 * i ] ) >> precShift} \\
\text{sumProdRefCur} &\text{ += ( refSampleList[ 2 * i ] * curSampleList[ 2 * i ] ) >> precShift}
\end{align*}
\]

The variable avgShift and avgOffset are derived as follows:

\[
\begin{align*}
\text{avgShift} &\text{ = Log2( numSamples / 2)} \\
\text{avgOffset} &\text{ = 1 << ( avgShift - 1 )}
\end{align*}
\]

The variables numerDiv and denomDiv are derived as follows:

\[
\begin{align*}
\text{denomDiv} &\text{ = ( ( sumRefSquare + ( sumRefSquare >> 7 ) ) << avgShift )} \\
\text{numerator} &\text{ = Clip3( 0, 2 * denomDiv, ( ( sumProdRefCur + ( sumRefSquare >> 7 ) ) << avgShift )} \\
&\text{ - ( sumRef * sumCur ) >> precShift )}
\end{align*}
\]

The variables shiftNumer and shiftDenom are derived as follows:

\[
\begin{align*}
\text{shiftDenom} &\text{ = Max( 0, floor( Log2( Abs( denomDiv ) ) ) - 5 )} \\
\text{shiftNumer} &\text{ = Max( 0, shiftDenom - 12 )}
\end{align*}
\]

The variables sNumerDiv and sDenomDiv are derived as follows:

\[
\begin{align*}
\text{sDenomDiv} &\text{ = denomDiv >> shiftDenom} \\
\text{sNumerDiv} &\text{ = numerator >> shiftNumer}
\end{align*}
\]

The value of variable divCoeff is derived from Table H-8 depending on sDenomDiv and the variables icWeight, and icOffset are derived as follows:

\[
\begin{align*}
\text{icWeight} &\text{ = ( sNumerDiv * divCoeff ) >> ( shiftDenom - shiftNumer + 10 )} \\
\text{icOffset} &\text{ = ( sumCur - ( ( icWeight * sumRef ) >> 5 ) + avgOffset ) >> avgShift}
\end{align*}
\]

H.8.5.3.3.7 Bilinear sample interpolation and residual prediction process

The process is only invoked if res_pred_flag is equal to 1.

Inputs to this process are:

- a luma location \((x_{Cb}, y_{Cb})\) specifying the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a luma location \((x_{Bl}, y_{Bl})\) specifying the top-left sample of the current luma prediction block relative to the top-left sample of the current luma coding block,
- a variable nCBs specifying the size of the current luma coding block,
- variables nPBW and nPBH specifying the width and the height, respectively, of the current prediction unit, prediction list utilization flags, predFlagL0 and predFlagL1,
- the prediction list indication X,
- the prediction list utilization flag predFlagLX,
- the reference index refIdxLX,
- the motion vectors mvLX, mvCLX

Outputs of this process are:

- the \((nPbW)\times(nPBH)\) array predSamplesLX,
- the \((nPbW/2)\times(nPBH/2)\) arrays predSamplesLXcb and predSamplesLXcr.

The location \((xP, yP)\) is derived by:

\[
xP = x_{Cb} + x_{Bl} \quad \text{(H-212)}
\]
\[
yP = y_{Cb} + y_{Bl} \quad \text{(H-213)}
\]

The variable ivRefFlag is set equal to \((\text{DiffPicOrderCnt}(\text{currPic}, \text{RefPicListX}\left[\text{refIdxLX}\right]) = = 0\)), and the variable availFlag is set equal to 0.

Depending on ivRefFlag and RpRefIdxLX, the following applies:

- If ivRefFlag is equal to 0 and RpRefIdxLX is not equal to −1, the variable availFlag is set equal to 1, the variable refIdxLX is set equal to RpRefIdxLX and the residual prediction motion vector scaling process as specified in subclause H.8.5.3.3.7.3 is invoked with the prediction list utilization variable equal to X, the motion vector mvLX, and the RefPicListX\left[\text{refIdxLX}\right] and as inputs and modified mvLX as output.
- Otherwise, when ivRefFlag is equal to 1, the following applies:
  - The derivation process for a motion vector from a reference block for residual prediction as specified in subclause H.8.5.3.3.7.4 is invoked with \((xP, yP), nPBW\) and \(nPBH, \text{RefPicListX}\left[\text{refIdxLX}\right]\), \(\text{mvLX}\), as inputs, and availFlag, motion vector \(\text{mvT}\) and prediction list utilization variable \(Y\) as outputs.
  - When availFlag is equal to 0 and RpRefIdxLX is not equal to −1, availFlag is set equal to 1, \(\text{mvT}\) is set equal to
The motion vector \( mv_{CLX} \) is set equal to \( mv_{LX} \).

The arrays \( \text{predSamplesL}_{XLX} \), \( \text{predSamplesL}_{XCb} \), and \( \text{predSamplesL}_{XCc} \) are derived as specified in the following:

- The reference picture consisting of an ordered two-dimensional array \( \text{refPicL}_{XLX} \) of luma samples and two ordered two-dimensional arrays \( \text{refPicL}_{XCb} \) and \( \text{refPicL}_{XCc} \) of chroma samples is derived by invoking the process specified in subclause 8.5.2.2.1 with \( \text{currRefIdx} \) as input.

- The arrays \( \text{predSamplesL}_{XLX} \), \( \text{predSamplesL}_{XCb} \), and \( \text{predSamplesL}_{XCc} \) are derived by invoking the bilinear sample interpolation process specified in H.8.5.3.3.7.1 with the luma locations \((x_{Cb}, y_{Cb})\), \((x_{Bl}, y_{Bl})\), the luma prediction block width \( n_{PbW} \), the luma prediction block height \( n_{PbH} \), the motion vectors \( mv_{LX}, mv_{CLX} \), and the reference arrays with \( \text{refPicL}_{XLX} \), \( \text{refPicL}_{XCb} \) and \( \text{refPicL}_{XCc} \) as the inputs.

When \( \text{availFlag} \) is equal to 1 and \( \text{iv_res_pred_weight_idx} \) is not equal to 0, the following applies:

- Depending on \( \text{ivRefFlag} \), the variables \( \text{rpPic}, \text{rpRefPic}, \text{mvRp} \) and \( \text{currRefIdx} \) are derived as specified in the following:

  - If \( \text{ivRefFlag} \) is equal to 0, the following applies:
    - Let \( \text{rpPic} \) be the picture with \( \text{PicOrderCnt}(\text{rpPic}) \) equal to \( \text{PicOrderCntVal} \) and \( \text{ViewIdx} \) equal to \( \text{RefViewIdx}[x \text{P}][y \text{P}] \).
    - Let \( \text{rpRefPic} \) be the picture with \( \text{PicOrderCnt}(\text{rpRefPic}) \) equal to \( \text{PicOrderCnt}(\text{rpPic}) \) and \( \text{ViewIdx} \) equal to \( \text{RefViewIdx}[x \text{P}][y \text{P}] \).
    - The variable \( \text{mvRp} \) is set equal to \( \text{MvDisp}[x \text{P}][y \text{P}] \).
    - The variable \( \text{currRefIdx} \) is set equal to \( \text{RfRefIdxLX} \).

  - Otherwise (\( \text{ivRefFlag} \) is equal to 1), the following applies:
    - Let \( \text{rpPic} \) be the picture \( \text{RefPicListY}[\text{RfRefIdxLX}] \). [Ed. (CY): here the interaction with F0105 needs to be further studied.]
    - Let \( \text{rpRefPic} \) be the picture with \( \text{PicOrderCnt}(\text{rpPic}) \) equal to \( \text{PicOrderCnt}(\text{rpPic}) \) and \( \text{ViewIdx} \) equal to \( \text{RefViewIdx}[x \text{P}][y \text{P}] \).
    - The variable \( \text{mvRp} \) is set equal to \( \text{mvT} \).
    - The variable \( \text{currRefIdx} \) is set equal to \( \text{RfRefIdxLX} \).

- The arrays \( \text{rpSamplesL}_{XLX} \), \( \text{rpSamplesL}_{XCb} \), and \( \text{rpSamplesL}_{XCc} \) are derived as specified in the following:

  - Let the reference picture sample arrays \( \text{rpPicL}_{XLX}, \text{rpPicL}_{XCb}, \text{and rpPicL}_{XCc} \) corresponding to decoded sample arrays \( \text{SL}, \text{SCb}, \text{and SCc} \) derived in subclause 8.7 for the previously-decoded picture \( \text{rpPic} \).

  - The arrays \( \text{rpSamplesL}_{XLX}, \text{rpSamplesL}_{XCb}, \) and \( \text{rpSamplesL}_{XCc} \) are derived by invoking the bilinear sample interpolation process specified in subclause H.8.5.3.3.7.1 with the luma locations \((x_{Cb}, y_{Cb})\) and \((x_{Bl}, y_{Bl})\), the luma prediction block width \( n_{PbW} \), the luma prediction block height \( n_{PbH} \), the motion vectors \( mv_{LX}, mv_{CLX} \) and the reference arrays with \( \text{rpPicL}_{XLX}, \text{rpPicL}_{XCb}, \text{and rpPicL}_{XCc} \) as the inputs.

- The arrays \( \text{rpRefSamplesL}_{XLX}, \text{rpRefSamplesL}_{XCb}, \) and \( \text{rpRefSamplesL}_{XCc} \) are derived as specified in the following:

  - Let the reference picture sample arrays \( \text{rpRefPicL}_{XLX}, \text{rpRefPicL}_{XCb}, \) and \( \text{rpRefPicL}_{XCc} \) corresponding to decoded sample arrays \( \text{SL}, \text{SCb}, \text{SCc} \) derived in subclause 8.7 for the previously-decoded picture \( \text{rpRefPic} \).

  - The arrays \( \text{rpRefSamplesL}_{XLX}, \text{rpRefSamplesL}_{XCb}, \) and \( \text{rpRefSamplesL}_{XCc} \) are derived by invoking the bilinear sample interpolation process specified in subclause H.8.5.3.3.7.1 with the luma locations \((x_{Cb}, y_{Cb})\), \((x_{Bl}, y_{Bl})\), the luma prediction block width \( n_{PbW} \), the luma prediction block height \( n_{PbH} \), the motion vector \( mv_{LX} \) equal to \( (mv_{LX} + \text{mvRp}) \) and the motion vector \( mv_{CLX} \) equal to \( (mv_{CLX} + \text{mvRp}) \), and the reference arrays with \( \text{rpRefPicL}_{XLX}, \text{rpRefPicL}_{XCb} \) and \( \text{rpRefPicL}_{XCc} \) as the inputs.

  - The variable \( \text{shiftVal} \) is set equal to \( (\text{iv_res_pred_weight_idx} - 1) \).

  - The modified prediction samples \( \text{predSamplesL}_{XLX}[x][y] \) with \( x = 0..\left(n_{PbW} - 1\right) \) and \( y = 0..\left(n_{PbH} - 1\right) \) are derived as specified in the following:

\[
\text{predSamplesL}_{XLX}[x][y] = \text{predSamplesL}_{XLX}[x][y] +
\]
H.8.5.3.3.7.1 Bilinear sample interpolation process

The specifications in subclause 8.5.3.3.3.1 apply with the following modifications:

- All invocations of the process specified in subclause 8.5.3.3.3.2 are replaced with invocations of the process specified in subclause H.8.5.3.3.7.2 with chromaFlag equal to 0 as additional input.

- All invocations of the process specified in subclause 8.5.3.3.3.3 are replaced with invocations of the process specified in subclause H.8.5.3.3.7.2 with chromaFlag equal to 1 as additional input.

H.8.5.3.3.7.2 Bilinear luma and chroma sample interpolation process

Inputs to this process are:

- a location in full-sample units (xInt, yInt),
- a location offset in fractional-sample units (xFrac, yFrac),
- a sample reference array refPicLX,
- a flag chromaFlag.

Output of this process is a predicted sample value predPartLX[ x ][ y ].

In Figure H-1, the positions labelled with A, B, C, and D represent samples at full-sample locations inside the given two-dimensional array refPicLX of samples.

The variable picWidthInSamples is set equal to pic_width_in_luma_samples and the variable picHeightInSamples is set equal to pic_height_in_luma_samples.

- If chromaFlag is equal 0, xFrac is set equal to ( xFrac << 1 ) and yFrac is set equal to ( yFrac << 1 ).
- Otherwise ( chromaFlag is equal to 1 ), picWidthInSamples is set equal to ( picWidthInSamples / SubWidthC ) and picHeightInSamples is set equal to ( picHeightInSamples / SubHeightC ).

The coordinates of positions A, B, C, and D are derived as follows:

\[
\begin{align*}
xA &= \text{Clip3}(0, \text{picWidthInSamples} - 1, \text{xInt}) \\
xB &= \text{Clip3}(0, \text{picWidthInSamples} - 1, \text{xInt} + 1) \\
xC &= \text{Clip3}(0, \text{picWidthInSamples} - 1, \text{xInt})
\end{align*}
\]
3D-HEVC

xD = Clip3( 0, picWidthInSamples − 1, xInt + 1 )

yA = Clip3( 0, picHeightInSamples − 1, yInt )

yB = Clip3( 0, picHeightInSamples − 1, yInt )

yC = Clip3( 0, picHeightInSamples − 1, yInt + 1 )

yD = Clip3( 0, picHeightInSamples − 1, yInt + 1 )

The value of predPartLX[ x ][ y ] is derived as specified in the following:

\[
\text{predPartLX}[ x ][ y ] = \left( \text{refPicLX}[ xA ][ yA ] \times ( 8 - xFrac ) \times ( 8 - yFrac ) + \text{refPicLX}[ xB ][ yB ] \times ( 8 - yFrac ) \times xFrac + \text{refPicLX}[xC ][ yC ] \times ( 8 - xFrac ) \times yFrac + \text{refPicLX}[xD ][ yD ] \times xFrac \times yFrac \right) >> 6
\]

H.8.5.3.7.4 Derivation process for a motion vector from a reference block for residual prediction

Inputs to this process are:

– A luma location ( xP, yP ) of the top-left luma sample of the current prediction unit relative to the top-left luma sample of the current picture,

– variables nPbW and nPbH specifying the width and the height, respectively, of the current prediction unit,

– a reference picture refPic,

– a motion vector mvDisp

Outputs of this process are:

– a flag availFlag

– a motion vector mvT

– prediction list utilization variable Y.

The variable availFlag is set to 0 and the reference luma location ( xRef, yRef ) in refPicLX is derived by

\[
\begin{align*}
xRef &= \text{Clip3}( 0, \text{PicWidthInSamplesL} - 1, xP + ( nPSW >> 1 ) + ( ( \text{mvDisp}[ 0 ] + 2 ) >> 2 ) ) \\
yRef &= \text{Clip3}( 0, \text{PicHeightInSamplesL} - 1, yP + ( nPSH >> 1 ) + ( ( \text{mvDisp}[ 1 ] + 2 ) >> 2 ) )
\end{align*}
\]

Let variable refCU and refPU be the coding unit and prediction unit that cover the luma location ( xRef, yRef ) in refPic, respectively.

When the variable PredMode for the coding unit refCU is equal to MODE_SKIP or MODE_INTER, the following ordered steps apply for X in the range of 0 to 1, inclusive:
The variable refPredFlagLX is set equal to the prediction utilization flag predFlagLX of the prediction unit refPU.

When availFlag is equal to 0 and refPredFlagLX is equal to 1, the following applies:

Let refPicListRefX be the reference picture list X of refPic.

Let mvLX and refIdxLX be the motion vector and reference index of the prediction unit refPU corresponding to refPicListRefX, respectively. [ Ed. (GT): What happens when refPredFlagLX is equal to 0? Ed. (CY): motion information not available, if both predFlagL0 and predFlagL1 are 0, the zero motion vector with ref index equal to RpRefIdxLX is used.]

When refPicListRefX[ refIdxLX ] is a temporal reference picture of refPic and RpRefIdxLX is not equal to −1, availFlag is set to 1, Y is set equal to X and the residual prediction motion vector scaling process as specified in subclause H.8.5.3.3.7.3 is invoked with the prediction list utilization variable equal to X, the motion vector mvLX, and the reference picture refPicListRefX[ refIdxLX ] as the inputs, and the output being mvT.

H.8.5.3.3.8 View synthesis prediction process

Inputs to this process are:

- a location ( xCb, yCb ) specifying the top-left sample of the current luma coding block relative to the top left sample of the current picture,

- a location ( xBl, yBl ) specifying the top-left sample of the current prediction block relative to the top left sample of the current coding block,

- the width and height of this prediction block, nPbW and nPbH,

- the prediction list indicator X

- the reference index refIdxLX

Outputs of this process are:

- an array predSamplesL of luma prediction samples,

- an array predSamplesCb of chroma prediction samples for the component Cb

- an array predSamplesCr of chroma prediction samples for the component Cr

The location ( xP, yP ) given in full-sample units of the upper-left luma samples of the current prediction block relative to the upper-left luma sample location of the current picture is derived by:

\[
xP = xCb + xBl
\]

\[
yP = yCb + yBl
\]

The reference picture consisting of an ordered two-dimensional array refPicL of luma samples and two ordered two-dimensional arrays refPicCb and refPicCr of chroma samples is derived by invoking the process specified in subclause 8.5.2.2.1 with refIdxLX as input.

The variable refViewIdx is set equal to the ViewIdx( RefPicListX[ refIdxLX ] ) and the variable depthViewIdx is set equal to RefViewIdx[ xCb + xBl ][ yCb + yBl ]. The variable mvDisp is set equal to MvDisp[ xCb + xBl ][ yCb + yBl ]

The derivation process for a disparity sample array as specified in section H.8.5.5.2 is invoked with the luma location ( xP, yP ), the disparity vector mvDisp, the variable refViewIdx, the variable depthViewIdx, the variable nPSW, the variable nPSH, and the variable splitFlag equal to 1 as the inputs, and the output is the array disparitySamples of size (nPSW)x(nPSH).

Let ( xIntL, yIntL ) be a luma location given in full-sample units and ( xFracL, yFracL ) be an offset given in quarter-sample units.

For each luma sample location ( xL = 0..nPbW − 1, yL = 0..nPbH − 1 ) inside the prediction luma sample array predSamplesL, the corresponding prediction luma sample value predSamplesL[ xL ][ yL ] is derived as follows:

- The variables xIntL, yIntL, xFracL, and yFracL are derived by

  \[
xIntL = xP + xL + \text{disparitySamples}[ xL ][ yL ]
\]

  \[
yIntL = yP + yL
\]

  \[
xFracL = \text{disparitySamples}[ xL ][ yL ] & 3
\] (H-237)
The prediction luma sample value \( \text{predSamples}_L[ x_L \| y_L ] \) is derived by invoking the process specified in subclause 8.5.3.3.3.2 with \( ( x\text{Int}_L, y\text{Int}_L ), ( x\text{Frac}_L, y\text{Frac}_L, ) \) and \( \text{refPic}_L \) given as input.

For \( x \) in the range of 0 to 1, inclusive, the variables \( \text{mvLX}, \text{mvCLX}, \text{refIdxLX}, \) and \( \text{predFlagLX} \) are derived as specified below.

\[ y\text{Frac}_L = 0 \quad \text{(H-238)} \]

For \( y \) in the range of 0 to 1, inclusive, the following applies:

\[ x\text{Sb} = x\text{Bl} + x \times n\text{SbW} \quad \text{(H-245)} \]
\[ y\text{Sb} = y\text{Bl} + y \times n\text{SbH} \quad \text{(H-246)} \]

\[ \text{mvLX} = \text{SubPbMvLX}[ x\text{Sb} \| y\text{Sb} ] \quad \text{(H-247)} \]
mvCLX = SubPbMvCLX[ xSb ][ ySb ]  \quad \text{(H-248)}
refIdxLX = SubPbRefIdxLX[ xSb ][ ySb ]  \quad \text{(H-249)}
predFlagLX = SubPbPredFlagLX[ xSb ][ ySb ]  \quad \text{(H-250)}

- The decoding process for inter sample prediction as specified in subclause H.8.5.3.1 is invoked with the luma coding block location \((xB, yB, yC, yC)\), the luma prediction block location \((xB, yB)\) equal to \((xSb, ySb)\), the luma coding block size block \(nCbS\), the luma prediction block width \(nPbW\) equal to \(nSbW\), the luma prediction block height \(nPbH\) equal to \(nSbH\), the luma motion vectors \(mvL0\) and \(mvL1\), the chroma motion vectors \(mvCL0\) and \(mvCL1\), the reference indices \(refIdxL0\) and \(refIdxL1\), and the prediction list utilization flags \(predFlagL0\) and \(predFlagL1\) as inputs, and the inter prediction samples \((predSamples)\) that are an \((nCbS)\times(nCbS)\) array \(predSamplesL\) of prediction luma samples, \((nCbS)\times(nCbS)\) arrays of chroma residual samples as inputs, and the output is a modified version of the \((nCbS)\times(nCbS)\) arrays \(resSamples\) of prediction chroma samples, one for each of the luma components \(Cb\) and \(Cr\), as outputs.

### H.8.5.4 Decoding process for the residual signal of coding units coded in inter prediction mode

#### H.8.5.4.1 General

**Inputs to this process are:**
- a luma location \((xB, yB, yC, yC)\) specifying the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a variable \(log2CbSize\) specifying the size of the current luma coding block.

**Outputs of this process are:**
- an \((nCbS)\times(nCbS)\) array \(resSamplesL\) of luma residual samples, where \(nCbS\) is derived as specified below,
- an \((nCbS)\times(nCbS)\) array \(resSamplesCb\) of chroma residual samples for the component \(Cb\), where \(nCbS\) is derived as specified below,
- an \((nCbS)\times(nCbS)\) array \(resSamplesCr\) of chroma residual samples for the component \(Cr\), where \(nCbS\) is derived as specified below.

The variable \(nCbS\) is set equal to \(1 << log2CbSize\) and the variable \(nCbS\) is set equal to \(nCbS\) >> 1.

Let \(resSamplesL\) be an \((nCbS)\times(nCbS)\) array of luma residual samples and let \(resSamplesCb\) and \(resSamplesCr\) be two \((nCbS)\times(nCbS)\) arrays of chroma residual samples.

- If \(inter_sdc_flag\) is equal to 0, the following applies, depending on the value of \(rqt_root_cbf\), the following applies:
  - If \(rqt_root_cbf\) is equal to 0 or \(skip_flag\) is equal to 1, all samples of the \((nCbS)\times(nCbS)\) array \(resSamplesL\) and all samples of the two \((nCbS)\times(nCbS)\) arrays \(resSamplesCb\) and \(resSamplesCr\) are set equal to 0.
  - Otherwise (\(rqt_root_cbf\) is equal to 1), the following ordered steps apply:
    1. The decoding process for luma residual blocks as specified in subclause H.8.5.4.2 below is invoked with the luma location \((xB, yB)\), the luma location \((xB0, yB0)\) set equal to \((0, 0)\), the variable \(log2TrafoSize\) set equal to \(log2CbSize\), the variable \(trafoDepth\) set equal to 0, the variable \(nCbS\) set equal to \(nCbS\)\textunderscore L, and the \((nCbS)\times(nCbS)\) array \(resSamplesL\) as inputs, and the output is a modified version of the \((nCbS)\times(nCbS)\) array \(resSamplesL\).
    2. The decoding process for chroma residual blocks as specified in subclause H.8.5.4.3 below is invoked with the luma location \((xB, yB)\), the luma location \((xB0, yB0)\) set equal to \((0, 0)\), the variable \(log2TrafoSize\) set equal to \(log2CbSize\), the variable \(trafoDepth\) set equal to 0, the variable \(cIdx\) set equal to 0, the variable \(nCbS\) set equal to \(nCbS\)\textunderscore C, and the \((nCbS)\times(nCbS)\) array \(resSamplesCb\) as inputs, and the output is a modified version of the \((nCbS)\times(nCbS)\) array \(resSamplesCb\).
    3. The decoding process for chroma residual blocks as specified in subclause H.8.5.4.3 below is invoked with the luma location \((xB, yB)\), the luma location \((xB0, yB0)\) set equal to \((0, 0)\), the variable \(log2TrafoSize\) set equal to \(log2CbSize\), the variable \(trafoDepth\) set equal to 0, the variable \(cIdx\) set equal to 0, the variable \(nCbS\) set equal to \(nCbS\)\textunderscore C, and the \((nCbS)\times(nCbS)\) array \(resSamplesCr\) as inputs, and the output is a modified version of the \((nCbS)\times(nCbS)\) array \(resSamplesCr\).

- Otherwise (\(inter_sdc_flag\) is equal to 1), the decoding process for simplified depth coded residual blocks as specified in subclause H.8.5.4.4 is invoked with the luma location \((xB, yB)\), the luma location \((xB0, yB0)\) set equal to \((0, 0)\), the variable \(log2TrafoSize\) set equal to \(log2CbSize\), the variable \(trafoDepth\) set equal to 0, the variable \(nCbS\)
set equal to nCbS_L and the (nCbS_L)x(nCbS_L) array resSamples_L as inputs, and the output is a modified version of the (nCbS_L)x(nCbS_L) array resSamples_L.

For x in the range of 0 to nCbS_L − 1 and y in the range of 0 to nCbS_L − 1, the following applies:

- ResSamples_L[ xCb + x ][ yCb + y ] is set equal to resSamples_L[ x ][ y ].

For x in the range of 0 to nCbS_L − 1 and y in the range of 0 to nCbS_L − 1, the following applies:

- ResSamples_Cb[ xCb /2 + x ][ yCb /2 + x ] is set equal to resSamples_Cb[ x ][ y ].
- ResSamples_Cr[ xCb /2 + x ][ yCb /2 + x ] is set equal to resSamples_Cr[ x ][ y ].

H.8.5.4.2 Decoding process for luma residual blocks

The specification in subclause 8.5.4.2 applies.

H.8.5.4.3 Decoding process for chroma residual blocks

The specification in subclause 8.5.4.3 applies.

H.8.5.4.4 Decoding process for simplified depth coded residual blocks

Inputs to this process are:

- a luma location (xCb, yCb) specifying the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a variable nCbS specifying the size of the current luma coding block,
- a (nCbS)x(nCbS) array resSamples of luma residual samples.

Output of this process is:

- a modified version of the (nCbS)x(nCbS) array of luma residual samples.

The values of the variables xOff, yOff, and interSdcResiIdx[ i ] for i in the range of 0 to 3, inclusive, depending on the value of PartMode are specified in Table H-9.

For x in the range of 0 to nCbS the following applies:

- For y in the range of 0 to nCbS the following applies:
  - The variable i is derived as specified in the following:
    - If x is less than xOff and y is less than yOff, i is set equal to 0.
    - Otherwise, if x greater than or equal to xOff and y is less than to yOff, i is set equal to 1.
    - Otherwise, if x less than xOff and y is greater than or equal to yOff, i is set equal to 2.
    - Otherwise, ( x is greater than or equal to xOff and y is greater than or equal to yOff), i is set equal to 3.
The value of resSamples[ x ][ y ] is set equal to InterSdcResi[ xCb ][ yCb ][ interSdcResiIdx[ i ] ].

### H.8.5.5 Derivation process for disparity vectors

Inputs to this process are:
- a luma location (xCb, yCb) of the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a variable nCbS specifying the size of the current luma coding block,
- the flag availableDV is set equal to 0, and both components of the disparity vector mvDisp are set equal to 0.

The variable checkParallelMergeFlag is derived as follows:
- If one or more of the following conditions are true, checkParallelMergeFlag is set equal to 1.
  - PredMode[ xCb ][ yCb ] is equal to MODE_SKIP.
  - PredMode[ xCb ][ yCb ] is equal to MODE_INTER and merge_flag[ xCb ][ yCb ] is equal to 1.
- Otherwise, checkParallelMergeFlag is set equal to 0.

The derivation process for a disparity vector from temporal neighbour block as specified in subclause H.8.5.5.1 is invoked with the luma location (xCb, yCb), and the variable nCbS as inputs, and the outputs are the flag availableDV, the disparity vector mvDisp and the reference view order index refViewIdx.

When availableDV is equal to 0, for each N being A1, B1 and (xN, yN) being (xCb − 1, yCb + nCbS − 1), (xCb + nCbS − 1, yCb − 1), respectively, the following ordered steps apply.

1. When yCb − 1 is less than ( ( yCb >> Log2CtbSizeY ) << Log2CtbSizeY ), the following applies.
   \[ xB_1 = (( xB_1 >> 3 ) << 3) + (( xB_1 >> 3 ) & 1) * 7 \] (H-251)

2. The derivation process for z-scan order block availability as specified in subclause 6.4.1 is invoked with (xCurr, yCurr) set equal to the (xCb, yCb) and the luma location (xN, yN) as the input and the output assigned to availableN.

3. When availableN is equal to 1 and PredMode[ xN ][ yN ] is equal to MODE_INTRA, availableN is set equal to 0. [Ed. (GT): 2+3 correspond to 6.4.2 for CU when (xN, yN) outside CU. Cross-check appreciated.]

4. When all of the following conditions are true, availableN is set equal to 0.
   - checkParallelMergeFlag is equal to 1
   - ( xCb >> ( log2_parallel_merge_level_minus2 + 2 ) ) is equal to ( xN >> ( log2_parallel_merge_level_minus2 + 2 ) )
   - ( yCb >> ( log2_parallel_merge_level_minus2 + 2 ) ) is equal to ( yN >> ( log2_parallel_merge_level_minus2 + 2 ) ).

5. The flag availableIvpMvSearchFlagN is set equal to availableN.

6. When one of the following conditions is true, N is equal to B1 and ( xN >> Log2CtbSizeY ) << Log2CtbSizeY is less than (( yCb >> Log2CtbSizeY ) << Log2CtbSizeY), availableIvpMvSearchFlagN is set equal to 0.

7. The flag availableFlagIvpMvN is set equal to 0.

8. For each X from 0 to 1, the following applies:
   - When availableDV is equal to 0, availableN is equal to 1, RefIdxLX[ xN ][ yN ] is greater than or equal to 0, and PredFlagLX[ xN ][ yN ] is equal to 1, the following applies:
     - If RefPicListX[ RefIdxLX[ xN ][ yN ] ] is an inter-view reference picture of the current picture, the following applies:
       \[ refViewIdx = ViewIdx( RefPicListX[ RefIdxLX[ xN ][ yN ] ] ) \] (H-252)
       \[ mvDisp = MvLXN[ xN ][ yN ] \] (H-253)
       \[ availableDV = 1 \] (H-254)
     - Otherwise (RefPicListX[ RefIdxLX[ xN ][ yN ] ] is not an inter-view reference picture), the following applies:
When availableIvpMvSearchFlagN is equal to 1, availableFlagIvpMvN is equal to 0, and PredMode[ xN ][ yN ] is equal to MODE_SKIP and IvpMvFlagLX[ xN ][ yN ] is equal to 1, the following applies:

\[
\text{ivpMvDispN} = \text{MvRefinedDisp}[ xN ][ yN ] \\
\text{refViewIdxN} = \text{RefViewIdx}[ xN ][ yN ] \\
\text{availableFlagIvpMvN} = 1
\] (H-255)

When availableDV is equal to 0 for each N being A₁ and B₁, the following applies.

- When availableDV is equal to 0 and availableFlagIvpMvN is equal to 1, the following applies:
  \[
  \text{mvDisp} = \text{ivpMvDispN} \\
  \text{refViewIdx} = \text{refViewIdxN} \\
  \text{availableDV} = 1
  \] (H-258)

When availableDV is equal to 0, refViewIdx is set equal to DefaultViewIdx, and mvDisp is set equal to (0, 0). The variable mvRefinedDisp is set equal to mvDisp.

When depth_refinement_flag[ nuh_layer_id ] is equal to 1, the following ordered steps apply:

1. The derivation process for a disparity sample array as specified in subclause H.8.5.5.2 is invoked with the luma locations xCb, yCb, the disparity vector mvDisp, the view identifier refViewIdx, the variable nPSW equal to nCbS, the variable nPSH equal to nCbS, and the variable splitFlag equal to 0 as the inputs, and the output is the array disparitySamples of size (nCbS)x(nCbS). When availableDV is equal to 0 for

- When availableDV is equal to 0 and availableFlagIvpMvN is equal to 1, the following applies:
  \[
  \text{mvDisp} = \text{ivpMvDispN} \\
  \text{refViewIdx} = \text{refViewIdxN} \\
  \text{availableDV} = 1
  \] (H-258)

When availableDV is equal to 0, refViewIdx is set equal to DefaultViewIdx, and mvDisp is set equal to (0, 0). The variable mvRefinedDisp is set equal to mvDisp.

When depth_refinement_flag[ nuh_layer_id ] is equal to 1, the following ordered steps apply:

- When availableDV is equal to 0 and availableFlagIvpMvN is equal to 1, the following applies:
  \[
  \text{mvDisp} = \text{ivpMvDispN} \\
  \text{refViewIdx} = \text{refViewIdxN} \\
  \text{availableDV} = 1
  \] (H-258)

When availableDV is equal to 0, refViewIdx is set equal to DefaultViewIdx, and mvDisp is set equal to (0, 0). The variable mvRefinedDisp is set equal to mvDisp.

When depth_refinement_flag[ nuh_layer_id ] is equal to 1, the following ordered steps apply:

1. The derivation process for a disparity sample array as specified in subclause H.8.5.5.2 is invoked with the luma locations xCb, yCb, the disparity vector mvDisp, the view identifier refViewIdx, the variable nPSW equal to nCbS, the variable nPSH equal to nCbS, and the variable splitFlag equal to 0 as the inputs, and the output is the array disparitySamples of size (nCbS)x(nCbS).

2. The horizontal component of the disparity vector mvRefinedDisp[ 0 ] is set equal to disparitySamples[ 0 ][ 0 ].

For use in derivation processes of variables invoked later in the decoding process, the following assignments are made for x = xCb..( xCb + nCbS – 1 ), y = yCb..( yCb + nCbS– 1 ):

\[
\text{MvDisp}[ x ][ y ] = \text{mvDisp} \\
\text{MvRefinedDisp}[ x ][ y ] = \text{mvRefinedDisp} \\
\text{RefViewIdx}[ x ][ y ] = \text{refViewIdx} \\
\text{DefaultDispFlag}[ x ][ y ] = \text{availableDV}
\] (H-261)

H.8.5.5.1 Derivation process for a disparity vector from temporal neighbour blocks

Inputs to this process are

- a luma location ( xCb, yCb ) specifying the top-left sample of the current luma coding block relative to the top-left luma sample of the current picture,
- a variable nCbS specifying the size of the current luma coding block.

Outputs of this process are

- the disparity vector mvDisp,
- the reference view order index refViewIdx,
- the availability flag availableFlag.

The luma location ( xCCtr, yCCtr) specifying the centre position of the current luma coding block is derived as follows:

\[
xCCtr = xCb + ( nCbS >> 1 ) \\
yCCtr = yCb + ( nCbS >> 1 )
\] (H-265)

The flag availableFlag is set equal to 0, and mvDisp is set equal to (0, 0).

For i from 0 to NumDdvCandPics – 1, inclusive, the following ordered steps apply and the whole decoding process of this sub-clause terminates once availableFlag is set to 1.

1. Let colPu the prediction unit in DdvCandPicsList[ i ] covering the position (( xCCtr >> 4 ) << 4, ( yCCtr >> 4 ) << 4).

2. The position ( xPCol, yPCol ) is set equal to the position of the top-left sample of colPu relative to the top-left luma sample of the DdvCandPicsList[ i ].
3D-HEVC

3. If slice_type is equal to B, the variable dir is set equal to collocated_from_l0_flag, otherwise, dir is set equal to 3 – collocated_from_l0_flag. [Ed. (GT) In software L0 is always checked first. Moreover the number of checks depends on the slice_type the of collocated slice.]

4. For each X from dir to 1 – dir, inclusive, the following applies:
   – The variables candPicRefPicList, candPredFlag, candRefIdx, and candMV are set equal to the variables RefPicListX, RefIdxLX, and MvLX of DvCandPicsList[ i ], respectively.
   – When colPu is not coded in an intra prediction mode and candPredFlag[ xPCol ][ yPCol ] is equal to 1, the following applies:
     – The variable candRefViewIdx is set equal to the ViewIdx( candPicRefPicList[ candRefIdx[ xPCol ][ yPCol ] ] ).
     – When candRefViewIdx is not equal to the ViewIdx( DvCandPicsList[ i ] ) and there is an inter-view reference picture with ViewIdx equal to candViewIdx in RefPicList0 or RefPicList1, the following applies:
       \[ \text{refViewIdx} = \text{candRefViewIdx} \]
       \[ \text{mvDisp} = \text{candMV}[ xPCol ][ yPCol ] \]
       \[ \text{availableFlag} = 1 \]

H.8.5.5.2 Derivation process for a disparity sample array

Inputs to this process are:
   – a luma location ( xP, yP ) relative to the top-left luma sample of the current picture,
   – a disparity vector mvDisp,
   – a view order index refViewIdx specifying a reference view,
   – a view order index depthViewIdx specifying the view the depth should be derived from
   – variables nPSW and nPSH specifying a width and a height, respectively
   – a variable splitFlag.

Outputs of this process are:
   – a (nPSW)x(nPSH) array disparitySamples of disparities values.

Let refDepPic the picture in the current access unit with ViewIdx( refDepPic ) equal to ViewIdx and DepthFlag( refDepPic ) equal to 1.

Let refDepPels be an array of reconstructed depth samples refDepPic. The luma location ( x_{TL}, y_{TL} ) of top-left luma sample of a block in refDepPels is derived by

\[ x_{TL} = xP + \left( \left( \text{mvDisp[ 0 ]} + 2 \right) \gg 2 \right) \]
\[ y_{TL} = yP + \left( \left( \text{mvDisp[ 1 ]} + 2 \right) \gg 2 \right) \]

The variables nSubBlkW and nSubBlkH are set equal to nPSW and nPSH, respectively.

When splitFlag is equal to 1, nSubBlkW, nSubBlkH are modified as specified in the following:
   – The variable minSubBlkSizeFlag is derived as specified in the following:
     \[ \text{minSubBlkSizeFlag} = \left( \text{nPSW} \% 8 \neq 0 \right) || \left( \text{nPSH} \% 8 \neq 0 \right) \]
   – Depending on the value of minSubBlkSizeFlag, the following applies.
     – If minSubBlkSizeFlag is equal to 1, the following applies:
       \[ \text{horSplitFlag} = \left( \text{nPSH} \% 8 \neq 0 \right) \]
     – Otherwise (minSubBlkSizeFlag is equal to 0), the following applies:
       \[ xP0 = \text{Clip3}( 0, \text{pic_width_in_luma_samples} - 1, x_{TL} ) \]
       \[ yP0 = \text{Clip3}( 0, \text{pic_height_in_luma_samples} - 1, y_{TL} ) \]
       \[ xP1 = \text{Clip3}( 0, \text{pic_width_in_luma_samples} - 1, x_{TL} + \text{nPSW} - 1 ) \]
The variable avgDep is derived as follows:

1. If xCb is greater than 0 and yCb is greater than 0, the following applies:
   \[
   \text{avgDep} = ( 5 * \lfloor xCb - 1 \rfloor + yCb - 1 ) + 6 * \lfloor xCb + nCbS - 1 \rfloor + 8 ) >> 4
   \]
   (H-281)

2. Otherwise, if xCb is equal to 0 and yCb is equal to 0, the following applies:
   \[
   \text{avgDep} = xCb - 1 || yCb + nCbS - 1
   \]
   (H-282)

3. Otherwise, if xCb is equal to 0 and yCb is greater than 0, the following applies:
   \[
   \text{avgDep} = xCb + nCbS - 1 || yCb - 1
   \]
   (H-283)

4. Otherwise, if xCb is greater than 0 and yCb is equal to 0, the following applies:
   \[
   \text{avgDep} = \text{avgDep} + 1
   \]
   (H-284)
3D-HEVC

$$mvDisp[0] = \text{DepthToDisparityB}[0][\text{avgDep}]$$

For use in derivation processes of variables invoked later in the decoding process, the following assignments are made for \(x = xC..(xCb + nCbS - 1), y = yCb..(yCb + nCbS - 1)\):

$$\text{MvRefinedDisp}[x][y] = mvDisp$$  \hspace{1cm} (H-285)
$$\text{RefViewIdx}[x][y] = 0$$  \hspace{1cm} (H-286)

H.8.6 Scaling, transformation and array construction process prior to deblocking filter process

The specifications in subclause 8.6 apply.

H.8.7 In-loop filter process

The specifications in subclause 8.7 apply.

H.9 Parsing process

H.9.1 General

The specifications in clause 9.1 apply with the following modifications

– All references to the process specified in subclause 7.3 are replaced with references to the process specified in subclause H.7.3.

– All invocations of the process specified in subclause 9.1 are replaced with invocations of the process specified in subclause H.9.1.

H.9.2 Parsing process for 0-th order Exp-Golomb codes

H.9.2.1 General

The specifications in subclause 9.2.1 apply with the following modifications.

– All references to the process specified in subclause 7.3 are replaced with references to the process specified in subclause H.7.3.

– All invocations of the process specified in subclause 9.2.2 are replaced with invocations of the process specified in subclause H.9.2.2.

H.9.2.2 Mapping process for signed Exp-Golomb codes

The specifications in subclause 9.2.1 apply with the following modifications.

– All references to the process specified in subclause 9.2 are replaced with references to the process specified in subclause H.9.2.1. \[Ed. (GT) Reference in base spec to 9.2 is wrong.\]

H.9.3 CABAC parsing process for slice segment data

H.9.3.1 General

The specifications in subclause 9.3.1 apply with the following modifications.

– All references to the process specified in subclauses 7.3.8.1 to through 7.3.8.11 are replaced with references to the process specified in subclauses H.7.3.8.1 to H.7.3.8.11

– All invocations of the process specified in subclause 9.3.2 are replaced with invocations of the process specified in subclause H.9.3.2.

– All invocations of the process specified in subclause 9.3.3 are replaced with invocations of the process specified in subclause H.9.3.3.

– All invocations of the process specified in subclause 9.3.4 are replaced with invocations of the process specified in subclause H.9.3.4.

– All invocations of the process specified in subclause 9.3.2.3 are replaced with invocations of the process specified in subclause H.9.3.2.3.
H.9.3.2 Initialization process

H.9.3.2.1 General

The specifications in subclause 9.3.1 apply with the following modifications.

– All invocations of the process specified in subclause 9.3.2.2 are replaced with invocations of the process specified in subclause H.9.3.2.2.

– All invocations of the process specified in subclause 9.3.2.4 are replaced with invocations of the process specified in subclause H.9.3.2.4.

H.9.3.2.2 Initialization process for context variables

The specifications in subclause 9.3.2.2 apply with the following modifications.

– All references to the process specified in subclauses 7.3.8.1 through 7.3.8.11 are replaced with references to the process specified in subclauses H.7.3.8.1 to H.7.3.8.11.

– Table H-10 is appended to the end of Table 9-4.

– Table H-11 to Table H-19 are appended to the end of the subclause.

The specifications in subclause 9.3.3.3 apply.

**H.9.3.3.4** Fixed-length (FL) binarization process  
The specifications in subclause 9.3.3.4 apply.

**H.9.3.3.5** Binarization process for part_mode  
The specifications in subclause 9.3.3.5 apply.

**H.9.3.3.6** Binarization process for intra_chroma_pred_mode  
The specifications in subclause 9.3.3.6 apply.

**H.9.3.3.7** Binarization process for inter_pred_idc  
The specifications in subclause 9.3.3.7 apply.

**H.9.3.3.8** Binarization process for cu_qp_delta_abs  
The specifications in subclause 9.3.3.8 apply.

**H.9.3.3.9** Binarization process for coeff_abs_level_remaining  
The specifications in subclause 9.3.3.9 apply.
H.9.3.3.10   **Binarization process for sdc_residual_abs_minus1**

Input to this process is a request for the a syntax element sdc_residual_abs_minus1.

Output of this process is the binarization of the syntax element.

The bin string is a concatenation of a prefix bin string and, when present, a suffix bin string.

The variable numDepthValues is derived as follows:

\[
\text{numDepthValues} = \text{DltFlag[ huh_layer_id ]} \cdot \left( 1 \ll \text{BitDepthY} \right) - 1
\]  

(H-287)

The variable cMaxPrefix is derived as follows:

\[
\text{cMaxPrefix} = ( \text{numDepthValues} \times 3 ) \gg 2
\]

For the derivation of the prefix bin string, the following applies:

– If sdc_residual_abs_minus1 is less than cMaxPrefix, the prefix bin string is a bit string of length sdc_residual_abs_minus1 + 1 indexed by binIdx. The bins for binIdx less than sdc_residual_abs_minus1 are equal to 1. The bin with binIdx equal to sdc_residual_abs_minus1 is equal to 0.

– Otherwise, the prefix bin string is a bit string of length cMaxPrefix with all bins being equal to 1.

When sdc_residual_abs_minus1 is greater than cMaxPrefix, the suffix of the bin string is present and it is derived as follows:

– The suffix value suffixVal, is derived as follows:

\[
\text{suffixVal} = \text{sdc_residual_abs_minus1} - \text{cMaxPrefix}
\]  

(H-288)

– The suffix of the bin string is specified by Fixed-length (FL) binarization process as specified in subclause with suffixVal and cMax equal to (numDepthValues − cMaxPrefix) as the inputs.

**H.9.3.4 Decoding process flow**

**H.9.3.4.1 General**

The specifications in subclause 9.3.4.1 apply, with the following modifications.

– All references to the process specified in subclause 9.3.3 are replaced with references to the process specified in subclause H.9.3.3.

– All invocations of the process specified in subclause 9.3.4.2 are replaced with invocations of the process specified in subclause H.9.3.4.2.

– All invocations of the process specified in subclause 9.3.4.3 are replaced with invocations of the process specified in subclause H.9.3.4.3.

**H.9.3.4.2 Derivation process for ctxTable, ctxIdx and bypassFlag**

**H.9.3.4.2.1 General**

The specifications in subclause 9.3.4.2.1 apply with the following modifications:

– Table H-22 is appended to the end of Table 9-37.

The specifications in subclause 9.3.4.2.4 apply.

H.9.3.4.2.5 Derivation process of ctxInc for the syntax element sig_coeff_flag

The specifications in subclause 9.3.4.2.5 apply.

H.9.3.4.2.6 Derivation process of ctxInc for the syntax element coeff_abs_level_greater1_flag

The specifications in subclause 9.3.4.2.6 apply.

H.9.3.4.2.7 Derivation process of ctxInc for the syntax element coeff_abs_level_greater2_flag

The specifications in subclause 9.3.4.2.7 apply.

H.9.3.4.3 Arithmetic decoding process

The specifications in subclause 9.3.4.3 apply, with the following modifications.

- All references to the process specified in subclause 9.3.4.2 are replaced with references to the process specified in subclause H.9.3.4.2.

H.9.3.5 Arithmetic encoding process (informative)

The specifications in subclause 9.3.5 apply with the following modifications.

- All references to the process specified in subclause 9.3.4.3 are replaced with references to the process specified in subclause H.9.3.4.3.
H.10 Sub-bitstream extraction process
The specifications in clause 10 apply.

H.11 Profiles and levels
The specifications in Annex A apply, with the following modification:
TBD

H.12 Byte stream format
The specifications in Annex B apply.

H.13 Hypothetical reference decoder
The specifications in clause F.13 apply.

H.14 Supplemental enhancement information
H.14.1 General
The specifications in clause F.14 apply.

H.14.2 SEI payload syntax
The specifications in subclause G.14.2 together with the extensions and modifications specified in this subclause apply.

H.14.2.1 Alternative depth information SEI message syntax
### H.14.3 SEI payload semantics

The specifications in subclause G.14.3 together with the extensions and modifications specified in this subclause apply.

#### H.14.3.1 Alternative depth information SEI message semantics

The alternative depth information SEI message indicates that decoded depth samples have to be interpreted as an alternative depth format. To discriminate different alternative depth formats, a depth_type syntax element is used. The information of the alternative depth information SEI message persists in output order until any of the following are true:

- A new CVS begins.
- The bitstream ends.
- A picture in an access unit containing an alternative depth information SEI message is output having PicOrderCntVal greater than PicOrderCnt(CurrPic).

**alternative_depth_info_cancel_flag** equal to 1 indicates that the SEI message cancels the persistence of any previous alternative depth information SEI message in output order. alternative_depth_info_cancel_flag equal to 0 indicates that alternative depth information follows.

**depth_type** identifies an alternative depth type according to Table H-24. A value of depth_type is equal to 0 indicates that this SEI message signals Global View and Depth (GVD) information. A value of depth_type is equal to 1 indicates that decoded depth samples can be used to derive a warp map and view synthesis can be performed by image-domain warping.

Values of depth_type that are not listed in Table H-24 are reserved for future use by ITU-T | ISO/IEC and shall not be present in bitstreams conforming to this version of this Specification. Decoders shall ignore alternative depth information

---

```c
alternative_depth_info (payloadSize) {
  alternative_depth_info_cancel_flag u(1)
  if (alternative_depth_info_cancel_flag == 0) {
    depth_type u(2)
    if (depth_type == 1) {
      min_offset_x_int se(v)
      min_offset_x_frac u(8)
      max_offset_x_int se(v)
      max_offset_x_frac u(8)
      offset_y_present_flag u(1)
      if (offset_y_present_flag) {
        min_offset_y_int se(v)
        min_offset_y_frac u(8)
        max_offset_y_int se(v)
        max_offset_y_frac u(8)
      }
      warp_map_size_present_flag u(1)
      if (warp_map_size_present_flag) {
        warp_map_width_minus2 ue(v)
        warp_map_height_minus2 ue(v)
      }
    }
    num_residual_texture_views_minus1 ue(v)
    residual_depth_flag u(1)
  }
}
```
SEI messages that contain reserved values of depth_type.

### Table H-24 – Interpretation of depth_type

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Global view and depth</td>
</tr>
<tr>
<td>1</td>
<td>Warp map</td>
</tr>
</tbody>
</table>

NOTE 2 – When depth_type is equal to 0, decoding processes for inter-view prediction and decoding processes with depth-texture interaction should be disabled.

\[ \text{min\_offset\_x\_int, min\_offset\_x\_frac} \] specify the integer and the fractional part of the minimum offset for the horizontal direction of a warp map.

The variable \( \text{minOffsetX} \) is derived as follows:

\[
\text{minOffsetX} = \text{min\_offset\_x\_int} + \text{min\_offset\_x\_frac} + 256
\]  
(H-289)

\[ \text{max\_offset\_x\_int, max\_offset\_x\_frac} \] specify the integer and the fractional part of the maximum offset for the horizontal direction of a warp map.

The variable \( \text{maxOffsetX} \) value is derived as follows:

\[
\text{maxOffsetX} = \text{max\_offset\_x\_int} + \text{max\_offset\_x\_frac} + 256
\]

\[ \text{offset\_y\_present\_flag} \] equal to 1 specifies that \( \text{min\_offset\_y\_int, min\_offset\_y\_frac, max\_offset\_y\_int and max\_offset\_y\_frac} \) are present. \( \text{offset\_y\_present\_flag} \) equal to 0 specifies that \( \text{min\_offset\_y\_int, min\_offset\_y\_frac, max\_offset\_y\_int and max\_offset\_y\_frac} \) are not present.

\[ \text{min\_offset\_y\_int, min\_offset\_y\_frac} \] specify the integer and the fractional part of the minimum offset for the vertical direction of a warp map. When not present, \( \text{min\_offset\_y\_int and min\_offset\_y\_frac} \) are inferred to be equal to 0.

The variable \( \text{minOffsetY} \) value is derived as follows:

\[
\text{minOffsetY} = \text{min\_offset\_y\_int} + \text{min\_offset\_y\_frac} + 256
\]  
(H-290)

\[ \text{max\_offset\_y\_int, max\_offset\_y\_frac} \] specify the integer and the fractional part of the maximum offset for the vertical direction of a warp map. When not present, \( \text{max\_offset\_y\_int and max\_offset\_y\_frac} \) are inferred to be equal to 0.

The variable \( \text{maxOffsetY} \) value is derived as follows:

\[
\text{maxOffsetY} = \text{max\_offset\_y\_int} + \text{max\_offset\_y\_frac} + 256
\]  
(H-291)

\[ \text{warp\_map\_size\_present\_flag} \] equal to 1 specifies that a new warp map size is present, which is valid for the current and all following warp maps in output order until a new message with \( \text{warp\_map\_size\_present\_flag} \) equal to 1 is received or \( \text{alternative\_depth\_info\_cancel\_flag} \) is equal to 0. \( \text{warp\_map\_size\_present\_flag} \) equal to 0 specifies that the warp map size is not changed.

\[ \text{warp\_map\_width\_minus2} \] plus 2 specifies the width of the warp map. The value of \( \text{warp\_map\_width\_minus2} \) shall be in the range of 0 to \( \text{pic\_width\_in\_luma\_samples} - 2 \), inclusive. The variable \( \text{warpMapWidth} \) is set equal to \( \text{warp\_map\_width\_minus2} + 2 \)

\[ \text{warp\_map\_height\_minus2} \] plus 2 specifies the height of the warp map. The value of \( \text{warp\_map\_height\_minus2} \) shall be in the range of 0 to \( \text{pic\_height\_in\_luma\_samples} \gg \text{offset\_y\_present\_flag} - 2 \), inclusive. The variable \( \text{warpMapHeight} \) is set equal to \( \text{warp\_map\_height\_minus2} + 2 \)

The variables \( \text{deltaX, deltaY, scaleX and scale Y} \) are derived as specified in the following:

\[
\text{deltaX} = \text{pic\_width\_in\_luma\_samples} \div (\text{warpMapWidth} - 1)
\]  
(H-292)

\[
\text{deltaY} = \text{pic\_height\_in\_luma\_samples} \div (\text{warpMapHeight} - 1)
\]  
(H-293)

\[
\text{scaleX} = (\text{maxOffsetX} - \text{minOffsetX}) \div ((1 << \text{BitDepth}_X) - 1)
\]  
(H-294)

\[
\text{scaleY} = (\text{maxOffsetY} - \text{minOffsetY}) \div ((1 << \text{BitDepth}_Y) - 1)
\]  
(H-295)

Let \( \text{recSamples}[x || y] \) correspond to the reconstructed sample array \( S_k \) of a depth view component. The corresponding horizontal warp map component \( w[x || y || 0] \) and the corresponding vertical warp map component \( w[x || y || 1] \) for \( \text{recSamples}[x || y] \) are derived as specified in the following:

\[
\text{for}(x = 0; x < \text{warpMapWidth} \; ; x++)
\]
A warp map \( w[ x ][ y ] \) is derived for each input view using reconstructed samples of its corresponding depth view component, i.e. each input view has an associated warp map and vice versa. A warp map specifies a sparse set of positional correspondences. These correspondences identify semantically corresponding image locations between two views of the same time instance, i.e. the associated input view and a neighbouring input view which is identified as follows.

When the warp map \( w[ x ][ y ] \) is associated with the leftmost input view, then the warp map specifies for each sub-pel position \((x*\delta X, y*\delta Y)\) in this input view a corresponding sub-pel position \((2*w[ x ][ y ][ 0 ], 2*w[ x ][ y ][ 1 ])\) in the closest input view on the right.

When the warp map \( w[ x ][ y ] \) is associated with an input view different to the leftmost input view, then the warp map specifies for each sub-pel position \((x*\delta X, y*\delta Y)\) in this input view a corresponding sub-pel position \((2*w[ x ][ y ][ 0 ], 2*w[ x ][ y ][ 1 ])\) in the closest input view on the left.

**NOTE 3** – A sample dense set of positional correspondences can be derived e.g. by bilinear interpolation.

\( \text{num_residual_texture_views_minus1} \) plus 1 specifies the number of sub-residual texture views packed in the residual texture layer. \( \text{num_residual_texture_views_minus1} \) shall be in the range of 0 to 3, inclusive.

\( \text{residual_depth_flag} \) equal to 1 specifies that the number of sub-residual depth views packed in the residual depth layer is equal to \( \text{num_residual_texture_views_minus1} + 1 \). residual_depth_flag equal to 0 specifies the number of sub-residual depth views is equal to 0 and that no residual depth layer is present in the bitstream.

When GVD information are signalled by the SEI message, information of multiple texture views are packed into two layers and information of multiple depth views is packed into one or two layers.

The two layers containing the texture views are the base texture layer and the residual texture layer. The base texture layer contains a base texture view in full resolution (e.g. the view from a central camera position) and is the layer with ViewIdx equal to 0 and DepthFlag equal to 0. The residual texture layer contains packed information of up to four additional views in quarter resolution (sub-residual texture views) and is the layer with ViewIdx equal to 1 and DepthFlag equal to 0.

Each sub-residual texture view is derived by applying the following to an additional texture input view:

- Project the base texture view to the position of the additional texture input view using the decoded base depth view (and the decoded residual depth view, when residual_depth_flag is equal to 1).
- Create a picture containing samples of the additional texture view that are located at positions not covered by projected sample positions of the base texture view.
- Decimate the created picture by a factor of two in horizontal and vertical direction by discarding odd sample positions.

With increasing order of camera IDs (which are specified by external means), the order of sub-residual texture views within the residual texture layer is top-left, top-bottom, bottom-left, bottom-right.

**NOTE 4** – An example is shown in Figure H-2. The variable \( N \) is set equal to \( \text{num_residual_texture_views_minus1} + 2 \). The base texture view (B) is the input from central camera (camera ID = 3). In the case \( N = 2 \), camera ID = 2 and 3 are used. In the case \( N = 3 \), camera ID = 2, 3 and 4 are used. In the case \( N = 4 \), camera ID = 1, 2, 3 and 4 are used. In the case \( N = 5 \), camera ID = 1, 2, 3, 4 and 5 are used. The \( N-1 \) input texture views with camera ID not equal to 3 are converted to \( N-1 \) quarter-size sub-residual texture views (R-x) and packed in the residual texture layer in order top-left (R-2), bottom-left (R-4), top-right (R-1) and bottom-right (R-5). Their top-left co-ordinates in the residual texture layer of width = \( W \) and height = \( H \) is shown in Table H-25. The residual texture layer represents occluded area or out-of-frame area of the base texture view when it is projected to the \( N-1 \) input texture views by GVD process.
The two layers containing the depth views are the base depth layer and the residual depth layer. The base depth layer contains a depth map in full resolution (base depth view) and is the layer with ViewIdx equal to 0 and DepthFlag equal to 1. The base depth view is generated as specified in the following:

- Project all depth maps associated with the additional texture views to the position of the base view.
- Derive the median of samples values projected to the same position.

When residual_depth_flag is equal to 0 and the number of input texture views is even (2 or 4), the position of the base depth view is the center of input views (e.g. camera ID = 2.5 when only cameras 2 and 3, or cameras 1, 2, 3 and 4 are present in the above example) and all depth maps are projected to this position, when the base depth view is generated.

When residual_depth_flag is equal to 1, the residual depth layer contains packed information derived from up to four depth views associated with the additional texture views in quarter resolution (sub-residual depth views). The residual depth layer is the layer with ViewIdx equal to 1 and DepthFlag equal to 1.

Each sub-residual depth view is derived by applying the following to an additional depth input view:

- Project the base depth view to the position of the additional depth input view using the decoded base depth view.
- Create a picture containing samples of the additional depth view that are located at positions not covered by projected sample positions of the base depth view.
- Decimate the created picture by a factor of two in horizontal and vertical direction by discarding odd sample positions.

The order of sub-residual depth views within the residual depth layer corresponds to the order of sub-residual texture layers in the residual texture layer.

**H.15 Video usability information**

The specifications in clause G.15 apply.
